National Center for Biotechnology Information (US), Bethesda (MD)

NLM Citation: Entrez Programming Utilities Help [Internet]. Bethesda (MD): National Center for Biotechnology Information (US); 2010-.
The Entrez Programming Utilities (E-utilities) are a set of eight server-side programs that provide a stable interface into the Entrez query and database system at the National Center for Biotechnology Information (NCBI). The E-utilities use a fixed URL syntax that translates a standard set of input parameters into the values necessary for various NCBI software components to search for and retrieve the requested data. The E-utilities are therefore the structured interface to the Entrez system, which currently includes 38 databases covering a variety of biomedical data, including nucleotide and protein sequences, gene records, three-dimensional molecular structures, and the biomedical literature.

Eric Sayers, PhD

Created: December 12, 2008; Updated: August 9, 2013.

Release Notes

Please see our Release Notes for details on recent changes and updates.

Introduction

This chapter provides a brief overview of basic E-utility functions along with examples of URL calls. Please see Chapter 2 for a general introduction to these utilities and Chapter 4 for a detailed discussion of syntax and parameters.

Examples include live URLs that provide sample outputs.

All E-utility calls share the same base URL:

Searching a Database

Basic Searching

esearch.fcgi?db=<database>&term=<query>

Input: Entrez database (&db); Any Entrez text query (&term)

Output: List of UIDs matching the Entrez query

Example: Get the PubMed IDs (PMIDs) for articles about breast cancer published in Science in 2008

Storing Search Results

esearch.fcgi?db=<database>&term=<query>&usehistory=y

Input: Any Entrez text query (&term); Entrez database (&db); &usehistory=y

---

1 NCBI; Email: sayers@ncbi.nlm.nih.gov.

* Corresponding author.
Output: Web environment (&WebEnv) and query key (&query_key) parameters specifying the location on the Entrez history server of the list of UIDs matching the Entrez query

Example: Get the PubMed IDs (PMIDs) for articles about breast cancer published in Science in 2008, and store them on the Entrez history server for later use

Associating Search Results with Existing Search Results

esearch.fcgi?db=<database>&term=<query1>&usehistory=y

# esearch produces WebEnv value ($web1) and QueryKey value ($key1)
esearch.fcgi?db=<database>&term=<query2>&usehistory=y&WebEnv=$web1

# esearch produces WebEnv value ($web2) that contains the results of both searches ($key1 and $key2)

Input: Any Entrez text query (&term); Entrez database (&db); &usehistory=y; Existing web environment (&WebEnv) from a prior E-utility call

Output: Web environment (&WebEnv) and query key (&query_key) parameters specifying the location on the Entrez history server of the list of UIDs matching the Entrez query

For More Information

Please see ESearch In-Depth for a full description of ESearch.

Sample ESearch Output

```xml
<?xml version="1.0" ?>
<eSearchResult>
  <Count>255147</Count>   # total number of records matching query
  <RetMax>20</RetMax>  # number of UIDs returned in this XML; default=20
  <RetStart>0</RetStart>  # index of first record returned; default=0
  <QueryKey>1</QueryKey>  # QueryKey, only present if &usehistory=y
  <WebEnv>0193yIkBjmM60UBXuvBvPfBiq8-9nIsldXuMP0hhuMH-8GjCz7F_Dz1XL6z@8397033B29A81FB01_0038SID</WebEnv>  # WebEnv; only present if &usehistory=y

</eSearchResult>

Searching PubMed with Citation Data

ecitmatch.cgi?db=pubmed&rettype=xml&bdata=<citations>

Input: List of citation strings separated by a carriage return (%0D), where each citation string has the following format:

journal_title|year|volume|first_page|author_name|your_key|

Output: A list of citation strings with the corresponding PubMed ID (PMID) appended.

Example: Search PubMed for the following citations:

Sample Output (the PMIDs appear in the rightmost field):

proc natl acad sci u s a|1991|88|3248|mann bj|Art1|2014248
science|1987|235|182|palmenberg ac|Art2|3026048

Please see ECitMatch In-Depth for a full description of ECitMatch.

Uploading UIDs to Entrez

Basic Uploading

epost.fcgi?db=<database>&id=<uid_list>

Input: List of UIDs (&id); Entrez database (&db)

Output: Web environment (&WebEnv) and query key (&query_key) parameters specifying the location on the Entrez history server of the list of uploaded UIDs

Example: Upload five Gene IDs (7173,22018,54314,403521,525013) for later processing.

db=gene&id=7173,22018,54314,403521,525013

Associating a Set of UIDs with Previously Posted Sets

epost.fcgi?db=<database1>&id=<uid_list1>

# epost produces WebEnv value ($web1) and QueryKey value ($key1)
epost.fcgi?db=<database2>&id=<uid_list2>&WebEnv=$web1

# epost produces WebEnv value ($web2) that contains the results of both posts ($key1 and $key2)

Input: List of UIDs (&id); Entrez database (&db); Existing web environment (&WebEnv)

Output: Web environment (&WebEnv) and query key (&query_key) parameters specifying the location on the Entrez history server of the list of uploaded UIDs

For More Information

Please see EPost In-Depth for a full description of EPost.

Sample EPost Output

<?xml version="1.0"?>
Downloading Document Summaries

Basic Downloading

esummary.fcgi?db=<database>&id=<uid_list>

Input: List of UIDs (&id); Entrez database (&db)

Output: XML DocSums

Example: Download DocSums for these protein GIs:
6678417,9507199,28558982,28558984,28558988,28558990

db=protein&id=6678417,9507199,28558982,28558984,28558988,28558990

Downloading Data From a Previous Search

esearch.fcgi?db=<database>&term=<query>&usehistory=y

# esearch produces WebEnv value ($web1) and QueryKey value ($key1)

esummary.fcgi?db=<database>&query_key=$key1&WebEnv=$web1

Input: Web environment (&WebEnv) and query key (&query_key) representing a set of
Entrez UIDs on the Entrez history server

Output: XML DocSums

Sample ESummary Output

The output of ESummary is a series of XML “DocSums” (Document Summaries), the
format of which depends on the database. Below is an example DocSum for Entrez
Protein.

<?xml version="1.0"?>
<!DOCTYPE eSummaryResult PUBLIC "-//NLM//DTD eSummaryResult, 29 October
<eSummaryResult>
<DocSum>
<Id>15718680</Id>
<Item Name="Caption" Type="String">NP_005537</Item>
<Item Name="Title" Type="String">IL2-inducible T-cell kinase [Homo sapiens]</Item>
<Item Name="Extra" Type="String">gi|15718680|ref|NP_005537.3|15718680</Item>
Sample ESummary version 2.0 Output

Version 2.0 of ESummary is an alternate XML presentation of Entrez DocSums. To retrieve version 2.0 DocSums, the URL should contain the &version parameter with an assigned value of '2.0'. Each Entrez database provides its own unique DTD for version 2.0 DocSums, and a link to the relevant DTD is provided in the header of the version 2.0 XML.

esummary.fcgi?db=<database>&id=<uid_list>&version=2.0

Below is an example version 2.0 DocSum from Entrez Protein (the same record as shown above in the default DocSum XML).

<?xml version="1.0"?>

**Downloading Full Records**

**Basic Downloading**

```
efetch.fcgi?db=<database>&id=<uid_list>&rettype=<retrieval_type>
&retmode=<retrieval_mode>
```

Input: List of UIDs (&id); Entrez database (&db); Retrieval type (&rettype); Retrieval mode (&retmode)

Output: Formatted data records as specified

*Example: Download nuccore GIs 34577062 and 24475906 in FASTA format*

db=nuccore&id=34577062,24475906&rettype=fasta&retmode=text

**Downloading Data From a Previous Search**

```
esearch.fcgi?db=<database>&term=<query>&usehistory=y
```

# esearch produces WebEnv value ($web1) and QueryKey value ($key1)

```
efetch.fcgi?db=<database>&query_key=$key1&WebEnv=$web1&rettype=
<retrieval_type>&retmode=<retrieval_mode>
```

Input: Entrez database (&db); Web environment (&WebEnv) and query key (&query_key) representing a set of Entrez UIDs on the Entrez history server; Retrieval type (&rettype); Retrieval mode (&retmode)

Output: Formatted data records as specified

**Downloading a Large Set of Records**

*Please see Application 3 in Chapter 3*

Input: Entrez database (&db); Web environment (&WebEnv) and query key (&query_key) representing a set of Entrez UIDs on the Entrez history server; Retrieval start (&retstart),
the first record of the set to retrieve; Retrieval maximum (&retmax), maximum number of records to retrieve

Output: Formatted data records as specified

For More Information
Please see EFetch In-Depth for a full description of EFetch.

Finding Related Data Through Entrez Links

Basic Linking

Batch mode – finds only one set of linked UIDs

elink.fcgi?dbfrom=<source_db>&db=<destination_db>&id=<uid_list>

Input: List of UIDs (&id); Source Entrez database (&dbfrom); Destination Entrez database (&db)

Output: XML containing linked UIDs from source and destination databases

Example: Find one set of Gene IDs linked to nuccore GIs 34577062 and 24475906

‘By Id’ mode – finds one set of linked UIDs for each input UID

elink.fcgi?dbfrom=<source_db>&db=<destination_db>&id=<uid1>&id=<uid2>&id=<uid3>...

Example: Find separate sets of Gene IDs linked to nuccore GIs 34577062 and 24475906

Note: &db may be a comma-delimited list of databases, so that elink returns multiple sets of linked UIDs in a single call

Finding Links to Data from a Previous Search

esearch.fcgi?db=<source_db>&term=<query>&usehistory=y

# esearch produces WebEnv value ($web1) and QueryKey value ($key1)

elink.fcgi?dbfrom=<source_db>&db=<destination_db>&query_key=$key1&WebEnv=$web1&cmd=neighbor_history

Input: Source Entrez database (&dbfrom); Destination Entrez database (&db); Web environment (&WebEnv) and query key (&query_key) representing the set of source UIDs on the Entrez history server; Command mode (&cmd)
Output: XML containing Web environments and query keys for each set of linked UIDs

Note: To achieve ‘By Id’ mode, one must send each input UID as a separate &id parameter in the URL. Sending a WebEnv/query_key set always produces Batch mode behavior (one set of linked UIDs).

Finding Computational Neighbors Limited by an Entrez Search

eLink:

elink.fcgi?dbfrom=<source_db>&db=<source_db>&id=<uid_list>&term=<query>&cmd=neighbor_history

Input: Source Entrez database (&dbfrom); Destination Entrez database (&db); List of UIDs (&id); Entrez query (&term); Command mode (&cmd)

Output: XML containing Web environments and query keys for each set of linked UIDs

Example: Find protein UIDs that are rat Reference Sequences and that are sequence similar to GI 15718680

For More Information

Please see ELink In-Depth for a full description of ELink.

Getting Database Statistics and Search Fields

einfo.fcgi?

Input: Entrez database (&db)

Output: XML containing database statistics

Note: If no database parameter is supplied, einfo will return a list of all valid Entrez databases.

Example: Find database statistics for Entrez Protein.

For More Information

Please see EInfo In-Depth for a full description of EInfo.

Performing a Global Entrez Search

equery.fcgi?term=<query>

Input: Entrez text query (&term)

Output: XML containing the number of hits in each database.

Example: Determine the number of records for mouse in Entrez.

For More Information

Please see EGQuery In-Depth for a full description of EGQuery.

Sample EGQuery Output

<?xml version="1.0"?>

Retrieving Spelling Suggestions

espell.fcgi?term=<query>&db=<database>

Input: Entrez text query (&term); Entrez database (&db)

Output: XML containing the original query and spelling suggestions.

Example: Find spelling suggestions for the PubMed Central query 'fiberblast cell growth'.

For More Information

Please see ESpell In-Depth for a full description of EGQuery.

Sample ESpell Output

```xml
<?xml version="1.0"?>
<eSpellResult>
  <Database>pmc</Database>
  <Query>fiberblast cell growth</Query>
  <CorrectedQuery>fibroblast cell growth</CorrectedQuery>
  <SpelledQuery>
    <Replaced>fibroblast</Replaced>
    <Original> cell </Original>
    <Replaced>growth</Replaced>
```
Demonstration Programs

EBot

EBot is an interactive web tool that first allows users to construct an arbitrary E-utility analysis pipeline and then generates a Perl script to execute the pipeline. The Perl script can be downloaded and executed on any computer with a Perl installation. For more details, see the EBot page linked above.

Sample Perl Scripts

The two sample Perl scripts below demonstrate basic E-utility functions. Both scripts should be copied and saved as plain text files and can be executed on any computer with a Perl installation.

ESearch-EFetch demonstrates basic search and retrieval functions.

```perl
#!/usr/local/bin/perl -w

**For More Information**

**Announcement Mailing List**

NCBI posts general announcements regarding the E-utilities to the *utilities-announce* announcement mailing list. This mailing list is an announcement list only; individual subscribers may not send mail to the list. Also, the list of subscribers is private and is not shared or used in any other way except for providing announcements to list members. The list receives about one posting per month. Please subscribe at the above link.

**Getting Help**

Please refer to the PubMed and Entrez help documents for more information about search queries, database indexing, field limitations and database content.

Suggestions, comments, and questions specifically relating to the EUtility programs may be sent to eutilities@ncbi.nlm.nih.gov.
Introduction

The Entrez Programming Utilities (E-utilities) are a set of nine server-side programs that provide a stable interface into the Entrez query and database system at the National Center for Biotechnology Information (NCBI). The E-utilities use a fixed URL syntax that translates a standard set of input parameters into the values necessary for various NCBI software components to search for and retrieve the requested data. The E-utilities are therefore the structured interface to the Entrez system, which currently includes 38 databases covering a variety of biomedical data, including nucleotide and protein sequences, gene records, three-dimensional molecular structures, and the biomedical literature.

To access these data, a piece of software first posts an E-utility URL to NCBI, then retrieves the results of this posting, after which it processes the data as required. The software can thus use any computer language that can send a URL to the E-utilities server and interpret the XML response; examples of such languages are Perl, Python, Java, and C++. Combining E-utilities components to form customized data pipelines within these applications is a powerful approach to data manipulation.

This chapter first describes the general function and use of the eight E-utilities, followed by basic usage guidelines and requirements, and concludes with a discussion of how the E-utilities function within the Entrez system.

Usage Guidelines and Requirements

Use the E-utility URL

All E-utility requests should be made to URLs beginning with the following string:

These URLs direct requests to servers that are used only by the E-utilities and that are optimized to give users the best performance.
Frequency, Timing and Registration of E-utility URL Requests

In order not to overload the E-utility servers, NCBI recommends that users post no more than three URL requests per second and limit large jobs to either weekends or between 9:00 PM and 5:00 AM Eastern time during weekdays. Failure to comply with this policy may result in an IP address being blocked from accessing NCBI. If NCBI blocks an IP address, service will not be restored unless the developers of the software accessing the E-utilities register values of the tool and email parameters with NCBI. The value of tool should be a string with no internal spaces that uniquely identifies the software producing the request. The value of email should be a complete and valid e-mail address of the software developer and not that of a third-party end user. The value of email will be used only to contact developers if NCBI observes requests that violate our policies, and we will attempt such contact prior to blocking access. In addition, developers may request that the value of email be added to the E-utility mailing list that provides announcements of software updates, known bugs and other policy changes affecting the E-utilities. To register tool and email values, simply send an e-mail to eutilities@ncbi.nlm.nih.gov including the desired values along with the name of either a developer or the organization creating the software. Once NCBI establishes communication with a developer, receives values for tool and email and validates the e-mail address in email, the block will be lifted. Once tool and email values are registered, all subsequent E-utility requests from that software package should contain both values. Please be aware that merely providing values for tool and email in requests is not sufficient to comply with this policy; these values must be registered with NCBI. Requests from any IP that lack registered values for tool and email and that violate the above usage policies may be blocked. Software developers may register values of tool and email at any time, and are encouraged to do so.

Minimizing the Number of Requests

If a task requires searching for and/or downloading a large number of records, it is much more efficient to use the Entrez History to upload and/or retrieve these records in batches rather than using separate requests for each record. Please refer to Application 3 in Chapter 3 for an example. Many thousands of IDs can be uploaded using a single EPost request, and several hundred records can be downloaded using one EFetch request.

Disclaimer and Copyright Issues

If you use the E-utilities within software, NCBI’s Disclaimer and Copyright notice (https://www.ncbi.nlm.nih.gov/About/disclaimer.html) must be evident to users of your product. Please note that abstracts in PubMed may incorporate material that may be protected by U.S. and foreign copyright laws. All persons reproducing, redistributing, or making commercial use of this information are expected to adhere to the terms and conditions asserted by the copyright holder. Transmission or reproduction of protected items beyond that allowed by fair use (PDF) as defined in the copyright laws requires the written permission of the copyright owners. NLM provides no legal advice concerning distribution of copyrighted materials. Please consult your legal counsel. If you wish to do a
large data mining project on PubMed data, you can enter into a licensing agreement and lease the data for free from NLM. For more information on this please see http://www.nlm.nih.gov/databases/leased.html.

Handling Special Characters Within URLs

When constructing URLs for the E-utilities, please use lowercase characters for all parameters except &WebEnv. There is no required order for the URL parameters in an E-utility URL, and null values or inappropriate parameters are generally ignored. Avoid placing spaces in the URLs, particularly in queries. If a space is required, use a plus sign (+) instead of a space:

Incorrect: &id=352, 25125, 234
Correct: &id=352,25125,234

Incorrect: &term=biomol mrna[properties] AND mouse[organism]
Correct: &term=biomol+mrna[properties]+AND+mouse[organism]

Other special characters, such as quotation marks ("), or the # symbol used in referring to a query key on the History server, should be represented by their URL encodings (%22 for "; %23 for #).

Incorrect: &term=#2+AND+"gene in genomic"[properties]
Correct: &term=%232+AND+%22gene+in+genomic%22[properties]

The Nine E-utilities in Brief

EInfo (database statistics)

eutils.ncbi.nlm.nih.gov/entrez/eutils/einfo.fcgi

Provides the number of records indexed in each field of a given database, the date of the last update of the database, and the available links from the database to other Entrez databases.

ESearch (text searches)

eutils.ncbi.nlm.nih.gov/entrez/eutils/esearch.fcgi

Responds to a text query with the list of matching UIDs in a given database (for later use in ESummary, EFetch or ELink), along with the term translations of the query.

EPost (UID uploads)

eutils.ncbi.nlm.nih.gov/entrez/eutils/post.fcgi

Accepts a list of UIDs from a given database, stores the set on the History Server, and responds with a query key and web environment for the uploaded dataset.
ESummary (document summary downloads)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/esummary.fcgi*

Responds to a list of UIDs from a given database with the corresponding document summaries.

EFetch (data record downloads)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/efetch.fcgi*

Responds to a list of UIDs in a given database with the corresponding data records in a specified format.

ELink (Entrez links)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/elink.fcgi*

Responds to a list of UIDs in a given database with either a list of related UIDs (and relevancy scores) in the same database or a list of linked UIDs in another Entrez database; checks for the existence of a specified link from a list of one or more UIDs; creates a hyperlink to the primary LinkOut provider for a specific UID and database, or lists LinkOut URLs and attributes for multiple UIDs.

EGQuery (global query)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/egquery.fcgi*

Responds to a text query with the number of records matching the query in each Entrez database.

ESpell (spelling suggestions)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/espell.fcgi*

Retrieves spelling suggestions for a text query in a given database.

ECitMatch (batch citation searching in PubMed)

*eutils.ncbi.nlm.nih.gov/entrez/eutils/ecitmatch.cgi*

Retrieves PubMed IDs (PMIDs) corresponding to a set of input citation strings.

Understanding the E-utilities Within Entrez

The E-utilities Access Entrez Databases

The E-utilities access the core search and retrieval engine of the Entrez system and, therefore, are only capable of retrieving data that are already in Entrez. Although the majority of data at NCBI are in Entrez, there are several datasets that exist outside of the
Entrez system. Before beginning a project with the E-utilities, check that the desired data can be found within an Entrez database.

**The Entrez System Identifies Database Records Using UIDs**

Each Entrez database refers to the data records within it by an integer ID called a UID (unique identifier). Examples of UIDs are GI numbers for Nucleotide and Protein, PMIDs for PubMed, or MMDB-IDs for Structure. The E-utilities use UIDs for both data input and output, and thus it is often critical, especially for advanced data pipelines, to know how to find the UIDs associated with the desired data before beginning a project with the E-utilities.

See Table 1 for a complete list of UIDs in Entrez.

**Table 1** – Entrez Unique Identifiers (UIDs) for selected databases

*Table 1 continues on next page...*
The Entrez Core Engine: EGQuery, ESearch, and ESummary

The core of Entrez is an engine that performs two basic tasks for any Entrez database: 1) assemble a list of UIDs that match a text query, and 2) retrieve a brief summary record called a Document Summary (DocSum) for each UID. These two basic tasks of the Entrez engine are performed by ESearch and ESummary. ESearch returns a list of UIDs that match a text query in a given Entrez database, and ESummary returns DocSums that match a list of input UIDs. A text search in web Entrez is equivalent to ESearch-ESummary. EGQuery is a global version of ESearch that searches all Entrez databases simultaneously. Because these three E-utilities perform the two core Entrez functions, they function for all Entrez databases.

```
egquery.fcgi?term=query
esearch.fcgi?db=database&term=query
esummary.fcgi?db=database&id=uid1,uid2,uid3,...
```

Syntax and Initial Parsing of Entrez Queries

Text search strings entered into the Entrez system are converted into Entrez queries with the following format:

```
```

where the terms are search terms, each limited to a particular Entrez field in square brackets, combined using one of three Boolean operators: Op = AND, OR, or NOT. These Boolean operators must be typed in all capital letters.
Example: human[organism] AND topoisomerase[protein name]

Entrez initially splits the query into a series of items that were originally separated by spaces in the query; therefore it is critical that spaces separate each term and Boolean operator. If the query consists only of a list of UID numbers (unique identifiers) or accession numbers, the Entrez system simply returns the corresponding records and no further parsing is performed. If the query contains any Boolean operators (AND, OR, or NOT), the query is split into the terms separated by these operators, and then each term is parsed independently. The results of these searches are then combined according to the Boolean operators.

A full account of how to search Entrez can be found in the Entrez Help Document. Additional information is available from Entrez Help.

**Entrez Databases: EInfo, EFetch, and ELink**

The NCBI Entrez system currently contains 38 databases. EInfo provides detailed information about each database, including lists of the indexing fields in the database and the available links to other Entrez databases.

`einfo.fcgi?db=database`

Each Entrez database includes two primary enhancements to the raw data records: 1) software for producing a variety of display formats appropriate to the given database, and 2) links to records in other Entrez databases manifested as lists of associated UIDs. The display format function is performed by EFetch, which generates formatted output for a list of input UIDs. For example, EFetch can produce abstracts from Entrez PubMed or FASTA format from Entrez Protein. EFetch does not yet support all Entrez databases; please see the EFetch documentation for details.

`efetch.fcgi?db=database&id=uid1,uid2,uid3&rettype=report_type&retmode=data_mode`

The linking function is performed by ELink, which generates a list of UIDs in a specified Entrez database that are linked to a set of input UIDs in either the same or another database. For example, ELink can find Entrez SNP records linked to records in Entrez Nucleotide, or Entrez Domain records linked to records in Entrez Protein.

`elink.fcgi?dbfrom=initial_database&db=target_database&id=uid1,uid2,uid3`

**Using the Entrez History Server**

A powerful feature of the Entrez system is that it can store retrieved sets of UIDs temporarily on the servers so that they can be subsequently combined or provided as input for other E-utility calls. The Entrez History server provides this service and is accessed on the Web using either the Preview/Index or History tabs on Entrez search pages. Each of the E-utilities can also use the History server, which assigns each set of UIDs an integer label called a query key (&query_key) and an encoded cookie string called a Web environment (&WebEnv). EPost allows any list of UIDs to be uploaded to
the History Server and returns the query key and Web environment. ESearch can also post its output set of UIDs to the History Server, but only if the &usehistory parameter is set to "y". ELink also can post its output to the History server if &cmd is set to "neighbor_history". The resulting query key and Web environment from either EPost or ESearch can then be used in place of a UID list in ESummary, EFetch, and ELink.

In Entrez, a set of UIDs is represented on the History by three parameters:

&db = database; &query_key = query key; &WebEnv = web environment

Upload steps that generate a web environment and query key

esearch.fcgi?db=database&term=query&usehistory=y

epost.fcgi?db=database&id=uid1,uid2,uid3,...

elink.fcgi?dbfrom=source_db&db=destination_db&cmd=neighbor_history&id=uid1,uid2,...

Download steps that use a web environment and query key

esummary.fcgi?db=database&WebEnv=webenv&query_key=key

efetch.fcgi?db=database&WebEnv=webenv&query_key=key&rettype=report_type&retmode=data_mode

Link step that uses a web environment and query key

elink.fcgi?dbfrom=initial_database&db=target_database&WebEnv=webenv&query_key=key

Search step that uses a web environment and a query key in the &term parameter (preceded by #, encoded as %23)

esearch.fcgi?db=database&term=%23key+AND+query&WebEnv=webenv&usehistory=y

**Generating Multiple Data Sets on the History Server**

Each web environment on the History Server can be associated with any number of query keys. This allows different data sets to be combined with the Boolean operators AND, OR, and NOT, or with another Entrez query. It is important to remember that for two data sets (query keys) to be combined, they must be associated with the same web environment. By default, successive E-utility calls produce query keys that are not associated with the same web environment, and so to overcome this, each E-utility call after the initial call must set the &WebEnv parameter to the value of the pre-existing web environment.

Default behavior: These two URLs...

**URL 1:** epost.fcgi?db=database&id=uid1,uid2,uid3
**URL 2:** esearch.fcgi?db=database&term=query&usehistory=y

will produce two History sets associated with different web environments:
Desired behavior: These two URLs...

URL 1: epost.fcgi?db=database&id=uid1,uid2,uid3
(extract web1 from the output of URL 1)
URL 2: esearch.fcgi?db=database&term=query&usehistory=y&WebEnv=web1

will produce two sets associated with the same (new) web environment:

URL   WebEnv   query_key   UIDs
1      web2     1          uid1,uid2,uid3
2      web2     1          uids matching query

Combining E-utility Calls to Create Entrez Applications

The E-utilities are useful when used by themselves in single URLs; however, their full potential is realized when successive E-utility URLs are combined to create a data pipeline. When used within such pipelines, the Entrez History server simplifies complex retrieval tasks by allowing easy data transfer between successive E-utility calls. Listed below are several examples of pipelines produced by combining E-utilities, with the arrows representing the passing of db, WebEnv and query_key values from one E-utility to another. These and related pipelines are discussed in detail in Chapter 3.

Basic Pipelines

Retrieving data records matching an Entrez query
ESearch → ESummary
ESearch → EFetch

Retrieving data records matching a list of UIDs
EPost → ESummary
EPost → EFetch

Finding UIDs linked to a set of records
ESearch → ELink
EPost → ELink

Limiting a set of records with an Entrez query
EPost → ESearch
ELink → ESearch
**Advanced Pipelines**

**Retrieving data records in database B linked to records in database A matching an Entrez query**

ESearch → ELink → ESummary

ESearch → ELink → EFetch

**Retrieving data records from a subset of an ID list defined by an Entrez query**

EPost → ESearch → ESummary

EPost → ESearch → EFetch

**Retrieving a set of data records, defined by an Entrez query, in database B from a larger set of records linked to a list of UIDs in database A**

EPost → ELink → ESearch → ESummary

EPost → ELink → ESearch → EFetch

**Demonstration Programs**

Please see Chapter 1 for sample Perl scripts.

**For More Information**

Please see Chapter 1 for getting additional information about the E-utilities.
Sample Applications of the E-utilities

Eric Sayers, PhD

Created: April 24, 2009; Updated: January 26, 2010.

Introduction

This chapter presents several examples of how the E-utilities can be used to build useful applications. These examples use Perl to create the E-utility pipelines, and assume that the LWP::Simple module is installed. This module includes the get function that supports HTTP GET requests. One example (Application 4) uses an HTTP POST request, and requires the LWP::UserAgent module. In Perl, scalar variable names are preceded by a "$" symbol, and array names are preceded by a "@". In several instances, results will be stored in such variables for use in subsequent E-utility calls. The code examples here are working programs that can be copied to a text editor and executed directly. Equivalent HTTP requests can be constructed in many modern programming languages; all that is required is the ability to create and post an HTTP request.

Basic Pipelines

All E-utility applications consist of a series of calls that we will refer to as a pipeline. The simplest E-utility pipelines consist of two calls, and any arbitrary pipeline can be assembled from these basic building blocks. Many of these pipelines conclude with either ESummary (to retrieve DocSums) or EFetch (to retrieve full records). The comments indicate those portions of the code that are required for either call.

ESearch – ESummary/EFetch

Input: Entrez text query

ESummary Output: XML Document Summaries

EFetch Output: Formatted data records (e.g. abstracts, FASTA)

use LWP::Simple;

# Download PubMed records that are indexed in MeSH for both asthma and # leukotrienes and were also published in 2009.

$db = 'pubmed';
$query = 'asthma[mesh]+AND+leukotrienes[mesh]+AND+2009[pdat]';
# assemble the esearch URL
$url = $base . "esearch.fcgi?db=$db&term=$query&usehistory=y";

# post the esearch URL
$output = get($url);

# parse WebEnv and QueryKey
$web = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

### include this code for ESearch-ESummary
# assemble the esummary URL
$url = $base . "esummary.fcgi?db=$db&query_key=$key&WebEnv=$web";

# post the esummary URL
$docsums = get($url);
print "$docsums";

### include this code for ESearch-EFetch
# assemble the efetch URL
$url = $base . "efetch.fcgi?db=$db&query_key=$key&WebEnv=$web&rettype=abstract&retmode=text";

# post the efetch URL
$data = get($url);
print "$data";

**EPost – ESummary/EFetch**

**Input:** List of Entrez UIDs (integer identifiers, e.g. PMID, GI, Gene ID)

**ESummary Output:** XML Document Summaries

**EFetch Output:** Formatted data records (e.g. abstracts, FASTA)

use LWP::Simple;

# Download protein records corresponding to a list of GI numbers.
$db = 'protein';
$id_list = '194680922,50978626,28558982,9507199,6678417';

# assemble the epost URL
$url = $base . "epost.fcgi?db=$db&id=$id_list";

# post the epost URL
$output = get($url);

# parse WebEnv and QueryKey
$web = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);
### include this code for EPost-ESummary
#assemble the esummary URL
$url = $base . "esummary.fcgi?db=$db&query_key=$key&WebEnv=$web";

#post the esummary URL
$docsums = get($url);
print "$docsums";

### include this code for EPost-EFetch
#assemble the efetch URL
$url = $base . "efetch.fcgi?db=$db&query_key=$key&WebEnv=$web";
$url .= "&rettype=fasta&retmode=text";

#post the efetch URL
$data = get($url);
print "$data";

**Note:** To post a large number (more than a few hundred) UIDs in a single URL, please use the HTTP POST method for the EPost call (see Application 4).

**ELink – ESummary/Efetch**

**Input:** List of Entrez UIDs in database A (integer identifiers, e.g. PMID, GI, Gene ID)

**ESummary Output:** Linked XML Document Summaries from database B

**EFetch Output:** Formatted data records (e.g. abstracts, FASTA) from database B

use LWP::Simple;

# Download gene records linked to a set of proteins corresponding to a list of GI numbers.

$db1 = 'protein';  # &dbfrom
$db2 = 'gene';     # &db
$linkname = 'protein_gene'; # desired link &linkname

#input UIDs in $db1 (protein GIs)
$id_list = '194680922,50978626,28558982,9507199,6678417';

#assemble the elink URL
$url = $base . "elink.fcgi?dbfrom=$db1&db=$db2&id=$id_list";
$url .= "&linkname=$linkname&cmd=neighbor_history"

#post the elink URL
$output = get($url);

#parse WebEnv and QueryKey
$web = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);  
$key = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);  

### include this code for ELink-ESummary
#assemble the esummary URL
$url = $base . "esummary.fcgi?db=$db&query_key=$key&WebEnv=$web";

#post the esummary URL
$docsums = get($url);
print "$docsums";

### include this code for ELink-EFetch
#assemble the.efetch URL
$url = $base . "efetch.fcgi?db=$db2&query_key=$key&WebEnv=$web";
$url .= "&rettype=xml&retmode=xml";

#post the efetch URL
$data = get($url);
print "$data";

**Notes:** To submit a large number (more than a few hundred) UIDs to ELink in one URL, please use the HTTP POST method for the Elink call (see Application 4). The &\_linkname parameter is used to force ELink to return only one set of links (one &\_query\_key) to simplify parsing. If more than one link is desired, the above code must be altered to parse the multiple &\_query\_key values from the ELink XML output. This code uses ELink in "batch" mode, in that only one set of gene IDs is returned and the one-to-one correspondence between protein GIs and gene IDs is lost. To preserve this one-to-one correspondence, please see Application 4 below.

**ESearch – ELink – ESummary/EFetch**

**Input:** Entrez text query in database A

**ESummary Output:** Linked XML Document Summaries from database B

**EFetch Output:** Formatted data records (e.g. abstracts, FASTA) from database B

```perl
use LWP::Simple;
# Download protein FASTA records linked to abstracts published # in 2009 that are indexed in MeSH for both asthma and # leukotrienes.
$db1 = 'pubmed';
$db2 = 'protein';
$linkname = 'pubmed_protein';
$query = 'asthma[mesh]+AND+leukotrienes[mesh]+AND+2009[pdat]';

#assemble the esearch URL
$url = $base . "esearch.fcgi?db=$db1&term=$query&usehistory=y";
#post the esearch URL
$output = get($url);

#parse WebEnv and QueryKey
$web1 = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
```
Sample Applications of the E-utilities 33

$key1 = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

#assemble the elink URL
$url = $base . "elink.fcgi?dbfrom=$db1&db=$db2";
$url .= "&query_key=$key1&WebEnv=$web1";
$url .= "&linkname=$linkname&cmd=neighbor_history";
print "$url\n";

#post the elink URL
$output = get($url);
print "$output\n";

#parse WebEnv and QueryKey
$web2 = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key2 = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

### include this code for ESearch-ELink-ESummary
#assemble the esummary URL
$url = $base . "esummary.fcgi?db=$db2&query_key=$key2&WebEnv=$web2";
#post the esummary URL
$dcsums = get($url);
print "$dcsums";

### include this code for ESearch-ELink-EFetch
#assemble the efetch URL
$url = $base . "efetch.fcgi?db=$db2&query_key=$key2&WebEnv=$web2";
$url .= "&rettype=fasta&retmode=text";
#post the efetch URL
$data = get($url);
print "$data";

Notes: The &linkname parameter is used to force ELink to return only one set of links (one &query_key) to simplify parsing. If more than one link is desired, the above code must be altered to parse the multiple &query_key values from the ELink XML output. This code uses ELink in "batch" mode, in that only one set of PubMed IDs is returned and the one-to-one correspondence between PubMed IDs and their related PubMed IDs is lost. To preserve this one-to-one correspondence, please see Application 4 below.

EPost – ELink – ESummary/EFetch

Input: List of Entrez UIDs (integer identifiers, e.g. PMID, GI, Gene ID) in database A

ESummary Output: Linked XML Document Summaries from database B

EFetch Output: Formatted data records (e.g. abstracts, FASTA) from database B

use LWP::Simple;

# Downloads gene records linked to a set of proteins corresponding
# to a list of protein GI numbers.
$db1 = 'protein';  # &dbfrom
$db2 = 'gene';     # &db
$linkname = 'protein_gene';
#input UIDs in $db1 (protein GIs)
$id_list = '194680922,50978626,28558982,9507199,6678417';

assemble the epost URL
$url = $base . "epost.fcgi?db=$db1&id=$id_list";

#post the epost URL
$output = get($url);

#parse WebEnv and QueryKey
$web1 = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key1 = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

assemble the elink URL
$url = $base . "elink.fcgi?dbfrom=$db1&db=$db2&query_key=$key1";
$url .= "&WebEnv=$web1&linkname=$linkname&cmd=neighbor_history";

#post the elink URL
$output = get($url);

#parse WebEnv and QueryKey
$web2 = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key2 = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

### include this code for ESearch-ELink-ESummary
#assemble the esummary URL
$url = $base . "esummary.fcgi?db=$db2&query_key=$key2&WebEnv=$web2";

#post the esummary URL
$docsums = get($url);
print "$docsums";

### include this code for ESearch-ELink-EFetch
#assemble the efetch URL
$url = $base . "efetch.fcgi?db=$db2&query_key=$key2&WebEnv=$web2";
$url .= "&rettype=xml&retmode=xml";

#post the efetch URL
$data = get($url);
print "$data";

Notes: To post a large number (more than a few hundred) UIDs in a single URL, please use the HTTP POST method for the EPost call (see Application 4 below). The &linkname parameter is used to force ELink to return only one set of links (one &query_key) to simplify parsing. If more than one link is desired, the above code must be altered to parse the multiple &query_key values from the ELink XML output. This code uses ELink in "batch" mode, in that only one set of gene IDs is returned and the one-to-one correspondence between protein
GI is and Gene IDs is lost. To preserve this one-to-one correspondence, please see Application 4 below.

**EPost – ESearch**

**Input:** List of Entrez UIDs (integer identifiers, e.g. PMID, GI, Gene ID)

**Output:** History set consisting of the subset of posted UIDs that match an Entrez text query

```perl
use LWP::Simple;

# Given an input set of protein GI numbers, this script creates
# a history set containing the members of the input set that
# correspond to human proteins.
# (Which of these proteins are from human?)
$db = 'protein';
$query = 'human[orgn]';
$id_list = '194680922,50978626,28558982,9507199,6678417';

# assemble the epost URL
$url = $base . 'epost.fcgi?db=$db&id=$id_list';

# post the epost URL
$output = get($url);

# parse WebEnv and QueryKey
$web = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

# assemble the esearch URL
$term = '%$key+AND+$query';
# %23 places a '#' before the query key
$url = $base . 'esearch.fcgi?db=$db&term=$term';
$url .= '&WebEnv=$web&usehistory=y';

# post esearch URL
$limited = get($url);

print "$limited
";

# Output remains on the history server (&query_key, &WebEnv)
# Use ESummary or EFetch as above to retrieve them

**Note:** To post a large number (more than a few hundred) UIDs in a single URL, please use the HTTP POST method for the EPost call (see Application 4).
**ELink – ESearch**

**Input:** List of Entrez UIDs (integer identifiers, e.g. PMID, GI, Gene ID) in database A

**Output:** History set consisting of the subset of linked UIDs in database B that match an Entrez text query

```
use LWP::Simple;

# Given an input set of protein GI numbers, this script creates a
# history set containing the gene IDs linked to members of the input
# set that also are on human chromosome X.
# (Which of the input proteins are encoded by a gene on human
# chromosome X?)

$db1 = 'protein';  # &dbfrom
$db2 = 'gene';     # &db
$linkname = 'protein_gene'; # desired link &linkname
$query = 'human[orgn]+AND+x[chr]';
#input UIDs in $db1 (protein GIs)
$id_list = '148596974,42544182,187937179,4557377,6678417';

#assemble the elink URL
$url = $base . "elink.fcgi?dbfrom=$db1&db=$db2&id=$id_list";
$url .= "&linkname=$linkname&cmd=neighbor_history";

#post the elink URL
$output = get($url);

#parse WebEnv and QueryKey
$web = $1 if ($output =~ /<WebEnv>(\S+)</WebEnv>/);
$key = $1 if ($output =~ /<QueryKey>(\d+)</QueryKey>/);

#assemble the esearch URL
$term = '%23$key+AND+$query';  # %23 places a '#' before the query key
$url = $base . "esearch.fcgi?db=$db2&term=$term&WebEnv=$web&usehistory=y";

#post esearch URL
$limited = get($url);

print "$limited\n";
```

**Note:** To submit a large number (more than a few hundred) UIDs to ELink in one URL, please use the HTTP POST method for the Elink call (see Application 4). The &linkname parameter is used to force ELink to return only one set of links (one &query_key) to simplify parsing. If more than one link is desired, the above code must be altered to parse the multiple &query_key values from the ELink XML output. This code uses ELink in "batch" mode, in
that only one set of gene IDs is returned and the one-to-one correspondence between protein GIs and Gene IDs is lost. To preserve this one-to-one correspondence, please see Application 4 below.

**Application 1: Converting GI numbers to accession numbers**

**Goal:** Starting with a list of nucleotide GI numbers, prepare a set of corresponding accession numbers.

**Solution:** Use EFetch with &retttype=acc

**Input:** $gi_list – comma-delimited list of GI numbers

**Output:** List of accession numbers.

```perl
use LWP::Simple;
$gi_list = '24475906,224465210,50978625,9507198';

# assemble the URL
$url = $base . 'efetch.fcgi?db=nucleotide&id=$gi_list&rettype=acc';

# post the URL
$output = get($url);
print $output;

**Notes:** The order of the accessions in the output will be the same order as the GI numbers in $gi_list.

**Application 2: Converting accession numbers to data**

**Goal:** Starting with a list of protein accession numbers, return the sequences in FASTA format.

**Solution:** Create a string consisting of items separated by 'OR', where each item is an accession number followed by '[accn]'.

Example: accn1[accn]+OR+accn2[accn]+OR+accn3[accn]+OR+...

Submit this string as a &term in ESearch, then use EFetch to retrieve the FASTA data.

**Input:** $acc_list – comma-delimited list of accessions

**Output:** FASTA data

```perl
use LWP::Simple;
$acc_list = 'NM_009417,NM_000547,NM_001003009,NM_019353';
@acc_array = split(/,/, $acc_list);

# append [accn] field to each accession
for ($i=0; $i < @acc_array; $i++) {
    $acc_array[$i] .= '[accn]';
}
$query = join('+OR+',@acc_array);

$url = $base . "esearch.fcgi?db=nucleotide&term=$query&usehistory=y";

$url .= "&rettype=fasta&retmode=text";

$url = $base . "efetch.fcgi?db=protein&query_key=$key&WebEnv=$web";

print "$fasta";

Notes: For large numbers of accessions, use HTTP POST to submit the esearch request (see Application 4), and see Application 3 below for downloading the large set in batches.

Application 3: Retrieving large datasets

Goal: Download all chimpanzee mRNA sequences in FASTA format (>50,000 sequences).

Solution: First use ESearch to retrieve the GI numbers for these sequences and post them on the History server, then use multiple EFetch calls to retrieve the data in batches of 500.

Input: $query – chimpanzee[orgn]+AND+biomol+mrna[prop]

Output: A file named "chimp.fna" containing FASTA data.
open output file for writing
open(OUT, ">chimp.fna") || die "Can't open file!\n"

retrieve data in batches of 500
$retmax = 500;
for ($retstart = 0; $retstart < $count; $retstart += $retmax) {
    $efetch_url = $base ."efetch.fcgi?db=nucleotide&WebEnv=$web";
    $efetch_url .= ";&query_key=$key&retstart=$retstart;"
    $efetch_url .= ";&retmax=$retmax&rettype=fasta&retmode=text;"
    $efetch_out = get($efetch_url);
    print OUT "$efetch_out";
} close OUT;

Application 4: Finding unique sets of linked records for each member of a large dataset

Goal: Download separately the SNP rs numbers (identifiers) for each current gene on human chromosome 20.

Solution: First use ESearch to retrieve the Gene IDs for the genes, and then assemble an ELink URL where each Gene ID is submitted as a separate &id parameter.

Output: A file named "snp_table" containing on each line the gene id followed by a colon (":") followed by a comma-delimited list of the linked SNP rs numbers.

use LWP::Simple;
use LWP::UserAgent;
$query = 'human[orgn]+AND+20[chr]+AND+alive[prop]';
$db1 = 'gene';
$db2 = 'snp';
$linkname = 'gene_snp';

#assemble the esearch URL
$url = $base . "esearch.fcgi?db=$db1&term=$query&usehistory=y&retmax=5000";

#post the esearch URL
$output = get($url);

#parse IDs retrieved
while ($output =~ /<Id>(\d+?)<\Id>/sg) {
    push(@ids, $1);
}

#assemble the elink URL as an HTTP POST call
$url = $base . "elink.fcgi";
$url_params = "dbfrom=$db1&db=$db2&linkname=$linkname";
foreach $id (@ids) {
$url_params .= "&id=$id;"
}

# create HTTP user agent
$ua = new LWP::UserAgent;
$ua->agent("elink/1.0 " . $ua->agent);

# create HTTP request object
$req = new HTTP::Request POST => "$url";
$req->content_type('application/x-www-form-urlencoded');
$req->content("$url_params");

# post the HTTP request
$response = $ua->request($req);
$output = $response->content;

open (OUT, ">snp_table") || die "Can't open file!\n"
while ($output =~ /<LinkSet>(.*?)</LinkSet>/sg) {
    $linkset = $1;
    if ($linkset =~ /<IdList>(.*?)</IdList>/sg) {
        $input = $1;
        $input_id = $1 if ($input =~ /<Id>(\d+)</Id>/sg);
    }
    while ($linkset =~ /<Link>(.*?)</Link>/sg) {
        $link = $1;
        push (@output, $1) if ($link =~ /<Id>(\d+)</Id>/);
    }
    print OUT "$input_id:" . join(',', @output) . "\n";
}
close OUT;

Notes: This example uses an HTTP POST request for the elink call, as the number of Gene IDs is over 500. The &retmax parameter in the ESearch call is set to 5000, as this is a reasonable limit to the number of IDs to send to ELink in one request (if you send 5000 IDs, you are effectively performing 5000 ELink operations). If you need to link more than 5000 records, add &retstart to the ESearch call and repeat the entire procedure for each batch of 5000 IDs, incrementing &retstart for each batch.

Demonstration Programs
Please see Chapter 1 for sample Perl scripts.

For More Information
Please see Chapter 1 for getting additional information about the E-utilities.
The E-utilities In-Depth: Parameters, Syntax and More

Eric Sayers, PhD

Created: May 29, 2009; Updated: January 9, 2017.

Introduction

This chapter serves as a reference for all supported parameters for the E-utilities, along with accepted values and usage guidelines. This information is provided for each E-utility in sections below, and parameters and/or values specific to particular databases are discussed within each section. Most E-utilities have a set of parameters that are required for any call, in addition to several additional optional parameters that extend the tool’s functionality. These two sets of parameters are discussed separately in each section.

General Usage Guidelines

Please see Chapter 2 for a detailed discussion of E-utility usage policy. The following two parameters should be included in all E-utility requests.

**tool**

Name of application making the E-utility call. Value must be a string with no internal spaces.

**email**

E-mail address of the E-utility user. Value must be a string with no internal spaces, and should be a valid e-mail address.

E-utility DTDs

With the exception of EFetch, the E-utilities each generate a single XML output format that conforms to a DTD specific for that utility. Links to these DTDs are provided in the XML headers of the E-utility returns.

ESummary version 2.0 produces unique XML DocSums for each Entrez database, and as such each Entrez database has a unique DTD for version 2.0 DocSums. Links to these DTDs are provided in the version 2.0 XML.

---

1 NCBI; Email: sayers@ncbi.nlm.nih.gov.

Corresponding author.
EFetch produces output in a variety of formats, some of which are XML. Most of these XML formats also conform to DTDs or schema specific to the relevant Entrez database. Please follow the link below for the PubMed DTD:

- PubMed DTD

**EInfo**

**Base URL**

**Functions**

- Provides a list of the names of all valid Entrez databases
- Provides statistics for a single database, including lists of indexing fields and available link names

**Required Parameters**

None. If no `db` parameter is provided, `einfo` will return a list of the names of all valid Entrez databases.

**Optional Parameters**

`db`

Target database about which to gather statistics. Value must be a valid Entrez database name.

`version`

Used to specify version 2.0 EInfo XML. The only supported value is ‘2.0’. When present, EInfo will return XML that includes two new fields: `<IsTruncatable>` and `<IsRangeable>`. Fields that are truncatable allow the wildcard character ‘*’ in terms. The wildcard character will expand to match any set of characters up to a limit of 600 unique expansions. Fields that are rangeable allow the range operator ‘:’ to be placed between a lower and upper limit for the desired range (e.g. 2008:2010[pdat]).

`retmode`

Retrieval type. Determines the format of the returned output. The default value is ‘xml’ for EInfo XML, but ‘json’ is also supported to return output in JSON format.

**Examples**

Return a list of all Entrez database names:

Return version 2.0 statistics for Entrez Protein:

**ESearch**

**Base URL**

**Functions**

- Provides a list of UIDs matching a text query
- Posts the results of a search on the History server
- Downloads all UIDs from a dataset stored on the History server
- Combines or limits UID datasets stored on the History server
- Sorts sets of UIDs

**Required Parameters**

**db**

Database to search. Value must be a valid Entrez database name (default = pubmed).

**term**

Entrez text query. All special characters must be URL encoded. Spaces may be replaced by '+' signs. For very long queries (more than several hundred characters long), consider using an HTTP POST call. See the PubMed or Entrez help for information about search field descriptions and tags. Search fields and tags are database specific.

esearch.fcgi?db=pubmed&term=asthma

**Optional Parameters – History Server**

**usehistory**

When usehistory is set to 'y', ESearch will post the UIDs resulting from the search operation onto the History server so that they can be used directly in a subsequent E utility call. Also, usehistory must be set to 'y' for ESearch to interpret query key values included in term or to accept a WebEnv as input.

**WebEnv**

Web environment string returned from a previous ESearch, EPost or ELink call. When provided, ESearch will post the results of the search operation to this pre-existing WebEnv, thereby appending the results to the existing environment. In addition, providing WebEnv allows query keys to be used in term so that previous search sets can
be combined or limited. As described above, if WebEnv is used, usehistory must be set to 'y'.

```
esearch.fcgi?db=pubmed&term=asthma&WebEnv=<webenv string>&usehistory=y
```

**query_key**

Integer query key returned by a previous ESearch, EPost or ELink call. When provided, ESearch will find the intersection of the set specified by query_key and the set retrieved by the query in term (i.e. joins the two with AND). For query_key to function, WebEnv must be assigned an existing WebEnv string and usehistory must be set to 'y'.

Values for query keys may also be provided in term if they are preceded by a '#' (%23 in the URL). While only one query_key parameter can be provided to ESearch, any number of query keys can be combined in term. Also, if query keys are provided in term, they can be combined with OR or NOT in addition to AND.

The following two URLs are functionally equivalent:

```
esearch.fcgi?db=pubmed&term=asthma&query_key=1&WebEnv=<webenv string>&usehistory=y
```

```
esearch.fcgi?db=pubmed&term=%231+AND+asthma&WebEnv=<webenv string>&usehistory=y
```

**Optional Parameters – Retrieval**

**restart**

Sequential index of the first UID in the retrieved set to be shown in the XML output (default=0, corresponding to the first record of the entire set). This parameter can be used in conjunction with retmax to download an arbitrary subset of UIDs retrieved from a search.

**retmax**

Total number of UIDs from the retrieved set to be shown in the XML output (default=20). By default, ESearch only includes the first 20 UIDs retrieved in the XML output. If usehistory is set to 'y', the remainder of the retrieved set will be stored on the History server; otherwise these UIDs are lost. Increasing retmax allows more of the retrieved UIDs to be included in the XML output, up to a maximum of 100,000 records. To retrieve more than 100,000 UIDs, submit multiple esearch requests while incrementing the value of restart (see Application 3).

**rettype**

Retrieval type. There are two allowed values for ESearch: 'uilist' (default), which displays the standard XML output, and 'count', which displays only the <Count> tag.
**Retmode**
Retrieval type. Determines the format of the returned output. The default value is ‘xml’ for ESearch XML, but ‘json’ is also supported to return output in JSON format.

**Sort**
Specifies the method used to sort UIDs in the ESearch output. The available values vary by database (db) and may be found in the Display Settings menu on an Entrez search results page. If `usehistory` is set to ‘y’, the UIDs are loaded onto the History Server in the specified sort order and will be retrieved in that order by ESummary or EFetch. Example values are ‘relevance’ and ‘name’ for Gene and ‘first+author’ and ‘pub+date’ for PubMed. Users should be aware that the default value of `sort` varies from one database to another, and that the default value used by ESearch for a given database may differ from that used on NCBI web search pages.

**Field**
Search field. If used, the entire search term will be limited to the specified Entrez field. The following two URLs are equivalent:

```
esearch.fcgi?db=pubmed&term=asthma&field=title

esearch.fcgi?db=pubmed&term=asthma[title]
```

**Optional Parameters – Dates**

**Datatype**
Type of date used to limit a search. The allowed values vary between Entrez databases, but common values are ‘mdat’ (modification date), ‘pdat’ (publication date) and ‘edat’ (Entrez date). Generally an Entrez database will have only two allowed values for `datetype`.

**Reldate**
When `reldate` is set to an integer n, the search returns only those items that have a date specified by `datetype` within the last n days.

**Mindate, Maxdate**
Date range used to limit a search result by the date specified by `datetype`. These two parameters (mindate, maxdate) must be used together to specify an arbitrary date range. The general date format is YYYY/MM/DD, and these variants are also allowed: YYYY, YYYY/MM.

**Examples**
Search in PubMed with the term `cancer` for abstracts that have an Entrez date within the last 60 days; retrieve the first 100 PMIDs and translations; post the results on the History server and return a `WebEnv` and `query_key`: 
Search in PubMed for the journal PNAS, Volume 97, and retrieve six PMIDs starting with the seventh PMID in the list:

db=pubmed&term=PNAS[ta]+AND+97[vi]&retstart=6&retmax=6&tool=biomed3

Search in the NLM Catalog for journals matching the term obstetrics:

db=nlmcatalog&term=obstetrics+AND+ncbijournals[filter]

Search PubMed Central for free full text articles containing the query stem cells:

Search in Nucleotide for all tRNAs:

db=nucleotide&term=biomol+trna[prop]

Search in Protein for a molecular weight range:

db=protein&term=70000:90000[molecular+weight]

EPost

Base URL

Functions

• Uploads a list of UIDs to the Entrez History server
• Appends a list of UIDs to an existing set of UID lists attached to a Web Environment

Required Parameters

  db

Database containing the UIDs in the input list. The value must be a valid Entrez database name (default = pubmed).
id

UID list. Either a single UID or a comma-delimited list of UIDs may be provided. All of the UIDs must be from the database specified by db. There is no set maximum for the number of UIDs that can be passed to epost, but if more than about 200 UIDs are to be posted, the request should be made using the HTTP POST method.

epost.fcgi?db=protein&id=15718680,157427902,119703751

Optional Parameter

WebEnv

Web Environment. If provided, this parameter specifies the Web Environment that will receive the UID list sent by post. EPost will create a new query key associated with that Web Environment. Usually this WebEnv value is obtained from the output of a previous ESearch, EPost or ELink call. If no WebEnv parameter is provided, EPost will create a new Web Environment and post the UID list to query_key 1.

epost.fcgi?db=protein&id=15718680,157427902,119703751&WebEnv=<webenv string>

Example

Post records to PubMed:

db=pubmed&id=11237011,12466850

ESummary

Base URL

Functions

- Returns document summaries (DocSums) for a list of input UIDs
- Returns DocSums for a set of UIDs stored on the Entrez History server

Required Parameter

db

Database from which to retrieve DocSums. The value must be a valid Entrez database name (default = pubmed).
Required Parameter – Used only when input is from a UID list

id

UID list. Either a single UID or a comma-delimited list of UIDs may be provided. All of the UIDs must be from the database specified by db. There is no set maximum for the number of UIDs that can be passed to ESummary, but if more than about 200 UIDs are to be provided, the request should be made using the HTTP POST method.

esummary.fcgi?db=protein&id=15718680,157427902,119703751

Required Parameters – Used only when input is from the Entrez History server

query_key

Query key. This integer specifies which of the UID lists attached to the given Web Environment will be used as input to ESummary. Query keys are obtained from the output of previous ESearch, EPost or ELink calls. The query_key parameter must be used in conjunction with WebEnv.

WebEnv

Web Environment. This parameter specifies the Web Environment that contains the UID list to be provided as input to ESummary. Usually this WebEnv value is obtained from the output of a previous ESearch, EPost or ELink call. The WebEnv parameter must be used in conjunction with query_key.

esummary.fcgi?db=protein&query_key=<key>&WebEnv=<webenv string>

Optional Parameters – Retrieval

retstart

Sequential index of the first DocSum to be retrieved (default=1, corresponding to the first record of the entire set). This parameter can be used in conjunction with retmax to download an arbitrary subset of DocSums from the input set.

retmax

Total number of DocSums from the input set to be retrieved, up to a maximum of 10,000. If the total set is larger than this maximum, the value of retstart can be iterated while holding retmax constant, thereby downloading the entire set in batches of size retmax.

retmode

Retrieval type. Determines the format of the returned output. The default value is ‘xml’ for ESummary XML, but ‘json’ is also supported to return output in JSON format.
version
Used to specify version 2.0 ESummary XML. The only supported value is ‘2.0’. When present, ESummary will return version 2.0 DocSum XML that is unique to each Entrez database and that often contains more data than the default DocSum XML.

EFetch
Base URL
Functions

- Returns formatted data records for a list of input UIDs
- Returns formatted data records for a set of UIDs stored on the Entrez History server

Required Parameters

db

Database from which to retrieve records. The value must be a valid Entrez database name (default = pubmed). Currently EFetch does not support all Entrez databases. Please see Table 1 in Chapter 2 for a list of available databases.

Required Parameter – Used only when input is from a UID list

id

UID list. Either a single UID or a comma-delimited list of UIDs may be provided. All of the UIDs must be from the database specified by db. There is no set maximum for the number of UIDs that can be passed to EFetch, but if more than about 200 UIDs are to be provided, the request should be made using the HTTP POST method.

efetch.fcgi?db=protein&id=15718680,157427902,119703751

Required Parameters – Used only when input is from the Entrez History server

query_key

Query key. This integer specifies which of the UID lists attached to the given Web Environment will be used as input to EFetch. Query keys are obtained from the output of previous ESearch, EPost or ELInk calls. The query_key parameter must be used in conjunction with WebEnv.

WebEnv

Web Environment. This parameter specifies the Web Environment that contains the UID list to be provided as input to EFetch. Usually this WebEnv value is obtained from the output of a previous ESearch, EPost or ELInk call. The WebEnv parameter must be used in conjunction with query_key.

efetch.fcgi?db=protein&query_key=<key>&WebEnv=<webenv string>
Optional Parameters – Retrieval

retmode

Retrieval mode. This parameter specifies the data format of the records returned, such as plain text, HTML or XML. See Table 1 for a full list of allowed values for each database.

**rettype**

Retrieval type. This parameter specifies the record view returned, such as Abstract or MEDLINE from PubMed, or GenPept or FASTA from protein. Please see Table 1 for a full list of allowed values for each database.

**retstart**

Sequential index of the first record to be retrieved (default=0, corresponding to the first record of the entire set). This parameter can be used in conjunction with **retnax** to download an arbitrary subset of records from the input set.
retmax
Total number of records from the input set to be retrieved, up to a maximum of 10,000. Optionally, for a large set the value of retstart can be iterated while holding retmax constant, thereby downloading the entire set in batches of size retmax.

Optional Parameters – Sequence Databases

strand
Strand of DNA to retrieve. Available values are "1" for the plus strand and "2" for the minus strand.

seq_start
First sequence base to retrieve. The value should be the integer coordinate of the first desired base, with "1" representing the first base of the sequence.

seq_stop
Last sequence base to retrieve. The value should be the integer coordinate of the last desired base, with "1" representing the first base of the sequence.

complexity
Data content to return. Many sequence records are part of a larger data structure or "blob", and the complexity parameter determines how much of that blob to return. For example, an mRNA may be stored together with its protein product. The available values are as follows:

<table>
<thead>
<tr>
<th>Value of complexity</th>
<th>Data returned for each requested GI</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>entire blob</td>
</tr>
<tr>
<td>1</td>
<td>bioseq</td>
</tr>
<tr>
<td>2</td>

</tr>
<tr>
<td>3</td>
<td>minimal nuc-prot</td>
</tr>
<tr>
<td>4</td>
<td>minimal pub-set</td>
</tr>
</tbody>
</table>

Examples

PubMed
Fetch PMIDs 17284678 and 9997 as text abstracts:

Fetch PMIDs in XML:

PubMed Central
Fetch XML for PubMed Central ID 212403:

Nucleotide/Nuccore
Fetch the first 100 bases of the plus strand of GI 21614549 in FASTA format:

Fetch the first 100 bases of the minus strand of GI 21614549 in FASTA format:

Fetch the nuc-prot object for GI 21614549:

Fetch the full ASN.1 record for GI 5:

Fetch FASTA for GI 5:

Fetch the GenBank flat file for GI 5:

Fetch GBSeqXML for GI 5:

Fetch TinySeqXML for GI 5:

Popset
Fetch the GenPept flat file for Popset ID 12829836:

Protein

Fetch the GenPept flat file for GI 8:

Fetch GBSeqXML for GI 8:

Sequences

Fetch FASTA for a transcript and its protein product (GIs 312836839 and 34577063)

Gene

Fetch full XML record for Gene ID 2:

ELink

Base URL

Functions

- Returns UIDs linked to an input set of UIDs in either the same or a different Entrez database
- Returns UIDs linked to other UIDs in the same Entrez database that match an Entrez query
- Checks for the existence of Entrez links for a set of UIDs within the same database
- Lists the available links for a UID
- Lists LinkOut URLs and attributes for a set of UIDs
- Lists hyperlinks to primary LinkOut providers for a set of UIDs
- Creates hyperlinks to the primary LinkOut provider for a single UID
Required Parameters

db
Database from which to retrieve UIDs. The value must be a valid Entrez database name (default = pubmed). This is the destination database for the link operation.

dbfrom
Database containing the input UIDs. The value must be a valid Entrez database name (default = pubmed). This is the origin database of the link operation. If db and dbfrom are set to the same database value, then ELink will return computational neighbors within that database. Please see the full list of Entrez links for available computational neighbors. Computational neighbors have linknames that begin with dbname_dbname (examples: protein_protein, pcassay_pcasay_activityneighbor).

cmd
ELink command mode. The command mode specified which function ELink will perform. Some optional parameters only function for certain values of &cmd (see below).

(cmd=neighbor) (default)
ELink returns a set of UIDs in db linked to the input UIDs in dbfrom.

Example: Link from protein to gene
dbfrom=protein&db=gene&id=15718680,157427902

(cmd=neighbor_score)
ELink returns a set of UIDs within the same database as the input UIDs along with computed similarity scores.

Example: Find related articles to PMID 20210808
dbfrom=pubmed&db=pubmed&id=20210808&cmd=neighbor_score

(cmd=neighbor_history)
ELink posts the output UIDs to the Entrez History server and returns a query_key and WebEnv corresponding to the location of the output set.

Example: Link from protein to gene and post the results on the Entrez History
dbfrom=protein&db=gene&id=15718680,157427902&cmd=neighbor_history

(cmd=acheck)
ELink lists all links available for a set of UIDs.

Example: List all possible links from two protein GIs

Example: List all possible links from two protein GIs to PubMed

ELink checks for the existence of links within the same database for a set of UIDs. These links are equivalent to setting db and dbfrom to the same value.

Example: Check whether two nuccore sequences have "related sequences" links.

Elink checks for the existence of external links (LinkOuts) for a set of UIDs.

Example: Check whether two protein sequences have any LinkOut providers.

For each input UID, ELink lists the URLs and attributes for the LinkOut providers that are not libraries.

Example: List the LinkOut URLs for non-library providers for two pubmed abstracts.

Example: List all LinkOut URLs for two PubMed abstracts.

For each input UID, ELink lists the URLs and attributes for all LinkOut providers including libraries.

Example: List all LinkOut URLs for two PubMed abstracts.

ELink lists the primary LinkOut provider for each input UID, or links directly to the LinkOut provider’s web site for a single UID if `retmode` is set to `ref`.

**Example: Find links to full text providers for two PubMed abstracts.**

**Example: Link directly to the full text for a PubMed abstract at the provider’s web site.**

**Required Parameter – Used only when input is from a UID list**

*id*

UID list. Either a single UID or a comma-delimited list of UIDs may be provided. All of the UIDs must be from the database specified by `dbfrom`. There is no set maximum for the number of UIDs that can be passed to ELink, but if more than about 200 UIDs are to be provided, the request should be made using the HTTP POST method.

*Link from protein to gene.*

*Find related sequences (link from nuccore to nuccore).*

If more than one `id` parameter is provided, ELink will perform a separate link operation for the set of UIDs specified by each `id` parameter. This effectively accomplishes "one-to-one" links and preserves the connection between the input and output UIDs.

*Find one-to-one links from protein to gene.*

**Required Parameters – Used only when input is from the Entrez History server**

*query_key*

Query key. This integer specifies which of the UID lists attached to the given Web Environment will be used as input to ELink. Query keys are obtained from the output of previous ESearch, EPost or ELInk calls. The `query_key` parameter must be used in conjunction with `WebEnv`. 
WebEnv

Web Environment. This parameter specifies the Web Environment that contains the UID list to be provided as input to ELink. Usually this WebEnv value is obtained from the output of a previous ESearch, EPost or ELink call. The WebEnv parameter must be used in conjunction with query_key.

Link from protein to gene:
```
elink.fcgi?dbfrom=protein&db=gene&query_key=<key>&WebEnv=<webenv string>
```

Find related sequences (link from protein to protein):
```
elink.fcgi?dbfrom=protein&db=protein&query_key=<key>&WebEnv=<webenv string>
```

Optional Parameters – Limiting the Output Set of Links

linkname

Name of the Entrez link to retrieve. Every link in Entrez is given a name of the form

dbfrom_db_subset.

The values of subset vary depending on the values of dbfrom and db. Many dbfrom/db combinations have no subset values. See the list of Entrez links for a listing of all available linknames. When linkname is used, only the links with that name will be retrieved.

The linkname parameter only functions when cmd is set to neighbor or neighbor_history.

Find all links from gene to snp.
```
dbfrom=gene&db=snp&id=93986
```

Find snps with genotype data linked to genes.
```
dbfrom=gene&db=snp&id=93986&linkname=gene_snp_genegenotype
```

term

Entrez query used to limit the output set of linked UIDs. The query in the term parameter will be applied after the link operation, and only those UIDs matching the query will be returned by ELink. The term parameter only functions when db and dbfrom are set to the same database value.

Find all related articles for a PMID.
```
dbfrom=pubmed&db=pubmed&id=19879512
```

Find all related review articles published in 2008 for a PMID.
dbfrom=pubmed&db=pubmed&id=19879512&term=review%5Bfilter%5D+AND+2008%5Bpdat%5Dh

holding

Name of LinkOut provider. Only URLs for the LinkOut provider specified by holding will be returned. The value provided to holding should be the abbreviation of the LinkOut provider's name found in the <NameAbbr> tag of the ELink XML output when cmd is set to links or linkslib. The holding parameter only functions when cmd is set to links or linkslib.

Find information for all LinkOut providers for a PMID.

dbfrom=pubmed&cmd=llinkslib&id=16210666

Find information from clinicaltrials.gov for a PMID.

dbfrom=pubmed&cmd=llinkslib&id=16210666&holding=CTgov

Optional Parameters – Dates

These parameters only function when cmd is set to neighbor or neighbor_history and dbfrom is pubmed.

datatype

Type of date used to limit a link operation. The allowed values vary between Entrez databases, but common values are 'mdat' (modification date), 'pdat' (publication date) and 'edat' (Entrez date). Generally an Entrez database will have only two allowed values for datatype.

reldate

When reldate is set to an integer n, ELink returns only those items that have a date specified by datatype within the last n days.

mindate, maxdate

Date range used to limit a link operation by the date specified by datatype. These two parameters (mindate, maxdate) must be used together to specify an arbitrary date range. The general date format is YYYY/MM/DD, and these variants are also allowed: YYYY, YYYY/MM.
**EGQuery**

**Base URL**

**Function**

Provides the number of records retrieved in all Entrez databases by a single text query.

**Required Parameter**

*term*

Entrez text query. All special characters must be URL encoded. Spaces may be replaced by ‘+’ signs. For very long queries (more than several hundred characters long), consider using an HTTP POST call. See the PubMed or Entrez help for information about search field descriptions and tags. Search fields and tags are database specific.

**ESpell**

**Base URL**

**Function**

Provides spelling suggestions for terms within a single text query in a given database.

**Required Parameters**

*db*

Database to search. Value must be a valid Entrez database name (default = pubmed).

*term*

Entrez text query. All special characters must be URL encoded. Spaces may be replaced by ‘+’ signs. For very long queries (more than several hundred characters long), consider using an HTTP POST call. See the PubMed or Entrez help for information about search field descriptions and tags. Search fields and tags are database specific.

**ECitMatch**

**Base URL**

**Function**
Retrieves PubMed IDs (PMIDs) that correspond to a set of input citation strings.

**Required Parameters**

**db**
Database to search. The only supported value is ‘pubmed’.

**rettype**
Retrieval type. The only supported value is ‘xml’.

**bdata**
Citation strings. Each input citation must be represented by a citation string in the following format:

```
journal_title|year|volume|first_page|author_name|your_key|
```

Multiple citation strings may be provided by separating the strings with a carriage return character (%0D). The `your_key` value is an arbitrary label provided by the user that may serve as a local identifier for the citation, and it will be included in the output. Be aware that all spaces must be replaced by ‘+’ symbols and that citation strings should end with a final vertical bar ‘|’.

**Release Notes**

**ESearch &sort; JSON output format: February 14, 2014**

- ESearch now provides a supported `sort` parameter
- EInfo, ESearch and ESummary now provide output data in JSON format

**ECitMatch, EInfo Version 2.0, EFetch: August 9, 2013**

- ECitMatch is a new E-utility that serves as an API to the PubMed batch citation matcher
- EInfo has an updated XML output that includes two new fields: <IsTruncatable> and <IsRangeable>
- EFetch now supports the BioProject database.

**EFetch Version 2.0. Target release date: February 15, 2012**

- EFetch now supports the following databases: biosample, biosystems and sra
- EFetch now has defined default values for &retmode and &rettype for all supported databases (please see Table 1 for all supported values of these parameters)
- EFetch no longer supports &retmode=html; requests containing &retmode=html will return data using the default &retmode value for the specified database (&db)
- EFetch requests including &rettype=docsum return XML data equivalent to ESummary output

**Release of new Genome database: November 9, 2011**

- Entrez Genome has been completely redesigned, and database records now correspond to a species rather than an individual chromosome sequence. Please see full details of the change at https://www.ncbi.nlm.nih.gov/About/news/17Nov2011.html
- Old Genome IDs are no longer valid. A file is available on the NCBI FTP site that maps old Genome IDs to Nucleotide GIs: ftp.ncbi.nih.gov/genomes/old_genomeID2nucGI
- EFetch no longer supports retrievals from Genome (db=genome).
- The ESummary XML for Genome has been recast to reflect the new data model.
- To view the new search fields and links supported for the new Genome database, please see https://eutils.ncbi.nlm.nih.gov/entrez/eutils/einfo.fcgi?db=genome

**ESummary Version 2.0. November 4, 2011**

- ESummary now supports a new, alternative XML presentation for Entrez document summaries (DocSums). The new XML is unique to each Entrez database and generally contains more extensive data about the record than the original DocSum XML.
- There are no plans at present to discontinue the original DocSum XML, so developers can continue to use this presentation, which will remain the default.
- Version 2.0 XML is returned when &version=2.0 is included in the ESummary URL.

**Demonstration Programs**

Please see Chapter 1 for sample Perl scripts.

**For More Information**

Please see Chapter 1 for getting additional information about the E-utilities.
The E-utility Web Service (SOAP)

Eric Sayers, PhD\textsuperscript{1} and Vadim Miller\textsuperscript{2}

Created: January 21, 2010; Updated: January 23, 2015.

Termination Announcement

The SOAP web service for the E-utilities will be \textbf{TERMINATED} permanently on July 1, 2015. All requests made to this service after that date will fail.

If you have software that is currently using the E-utility SOAP web service, please plan to transition to using the standard URL interface described in Chapters 1-4 of this book.

Please contact info@ncbi.nlm.nih.gov if you have questions about this change.

For More Information

E-utility DTDs

Please see Chapter 1 for getting additional information about the E-utilties.

\# Corresponding author.
Entrez Direct: E-utilities on the UNIX Command Line

Jonathan Kans, PhD

Getting Started

Introduction

Entrez Direct (EDirect) provides access to the NCBI's suite of interconnected databases (publication, sequence, structure, gene, variation, expression, etc.) from a UNIX terminal window. Functions take search terms from command-line arguments. Individual operations are combined to build multi-step queries. Record retrieval and formatting normally complete the process.

EDirect also includes an argument-driven function that simplifies the extraction of data from document summaries or other results that are returned in structured XML format. This can eliminate the need for writing custom software to answer ad hoc questions. Queries can move seamlessly between EDirect commands and UNIX utilities or scripts to perform actions that cannot be accomplished entirely within Entrez.

Installation

EDirect will run on UNIX and Macintosh computers that have the Perl language installed, and under the Cygwin UNIX-emulation environment on Windows PCs. To install the EDirect software, copy the following commands and paste them into a terminal window:

```
cd ~
perl -MNet::FTP -e \
  '$ftp = new Net::FTP("ftp.ncbi.nlm.nih.gov", Passive => 1); 
$ftp->login; $ftp->binary; 
$ftp->get("/entrez/entrezdirect/edirect.tar.gz");'
gunzip -c edirect.tar.gz | tar xf -
rm edirect.tar.gz
export PATH=$PATH:$HOME/edirect
./edirect/setup.sh
```

This downloads several scripts into an "edirect" folder in the user's home directory. The setup.sh script then downloads any missing Perl modules, and may print an additional

---

1 NCBI; Email: kans@ncbi.nlm.nih.gov.

Corresponding author.
command for updating the PATH environment variable in the user's configuration file. Copy that command, if present, and paste it into the terminal window to complete the installation process. The editing instructions will look something like:

```
  echo "export PATH=\$PATH:\$HOME/edirect" >> $HOME/.bash_profile
```

The configuration file can instead be modified manually using a text editor, if desired.

**Entrez Direct Functions**

Navigation functions support exploration within the Entrez databases:

- **esearch** performs a new Entrez search using terms in indexed fields.
- **elink** looks up neighbors (within a database) or links (between databases).
- **efilter** filters or restricts the results of a previous query.

Records can be retrieved in specified formats or as document summaries:

- **efetch** downloads records or reports in a designated format.

Desired fields from XML results can be extracted without writing a program:

- **xtract** converts XML into a table of data values.

Several additional functions are also provided:

- **einfo** obtains information on indexed fields in an Entrez database.
- **epost** uploads unique identifiers (UIDs) or sequence accession numbers.
- **nquire** sends a URL request to a web page or CGI service.

**Entering Query Commands**

UNIX programs are run by typing the name of the program and then supplying any required or optional arguments on the command line. Argument names are letters or words that start with a dash ("-") character.

In order to begin an Entrez search, the user types "esearch" and then enters the required -db (database) and -query arguments. A query on unqualified search terms:

```
esearch -db pubmed -query "opsin gene conversion"
```

constructs the appropriate Entrez Utilities (E-utilities) URL from the query terms and executes the search. EDirect handles many technical details behind the scenes (avoiding the learning curve normally required for E-utilities programming), and saves the results on the Entrez history server.
Constructing Multi-Step Queries

EDirect allows individual operations to be described separately, combining them into a multi-step query by using the vertical bar ("|") UNIX pipe symbol. Piping esearch to elink:

```
esearch -db pubmed -query "opsin gene conversion" | elink -related
```

will look up related articles (precomputed PubMed neighbors) of the initial results.

Writing Commands on Multiple Lines

A query can be continued on the next line by typing the backslash (\") UNIX escape character immediately before pressing the Return key. Continuing the query links to all protein sequences published in the neighbor articles:

```
esearch -db pubmed -query "opsin gene conversion" | \
elink -related | \
elink -target protein
```

The vertical bar pipe symbol also allows the query to continue on the next line.

Retrieving PubMed Reports

Piping PubMed query results to efetch and specifying the "abstract" format:

```
esearch -db pubmed -query "lycopene cyclase" | efetch -format abstract
```

returns a set of reports that can be read by a person:

```
... 

Levels of lycopene β-cyclase 1 modulate carotenoid gene expression and accumulation in Daucus carota.

Moreno JC(1), Pizarro L, Fuentes P, Handford M, Cifuentes V, Stange C.

Author information:
(1)Departamento de Biología, Facultad de Ciencias, Universidad de Chile, Santiago, Chile.

Plant carotenoids are synthesized and accumulated in plastids through a highly regulated pathway. Lycopene β-cyclase (LCYB) is a key enzyme involved directly in the synthesis of α-carotene and β-carotene through ...
```

Using efetch -format "medline" instead produces a report that can be entered into common bibliographic management software packages:

```
...
PMID- 23555569
OWN - NLM
```
Levels of lycopene beta-cyclase 1 modulate carotenoid gene expression and accumulation in Daucus carota.

Plant carotenoids are synthesized and accumulated in plastids through a highly regulated pathway. Lycopene beta-cyclase (LCYB) is a key enzyme involved directly in the synthesis of alpha-carotene and ...

Retrieving Sequence Reports

Nucleotide and protein records can be downloaded in FASTA format:

```
esearch -db protein -query "lycopene cyclase" |
efetch -format fasta
```

which consists of a definition line followed by the sequence:

```
>gi|735882|gb|AAA81880.1| lycopene cyclase [Arabidopsis thaliana]
MDTLKKTPNLDFIFQFQFHERLCSNPFPSRVRLGVKRAIKIVSVSVSGAALLDLVPETKLENLF
ELPLYDTSKQSVDRAIVGGGPAGLAVAQVSEAGLSICSIDPSPKL1WPNNYGVWDEFEAMDLCL

QASVVLDATGSRCLVQDKPYFQNYQYQVAGYIAEVDGHPFDVDMKDFDKDLYSDYPELKERNSKIP
TFYAMPFSSNNIFLEETLSVARGMPGMRDEMIEQERMAARLKHGLINVKRIEEDERCVIPIGMGLPVLYQRV
VG1G1GTVHPSTGVMARTLAA1APIVANAIVRYLGSNSSRLGQRQDGQSAEVWRDLWPIERRRQ1EFC
FGMD1LKLDDLADTTFFDADFLQPHYWHGFLLSSRLFLLPFLVGLGLSLFHASNTSRLE1MTKGTVPLA
KMINNLVQDRD
```

Additional FASTA -format variants are fasta_cds_na, fasta_cds_aa, and gene_fasta.

Sequence records can also be obtained as GenBank (-format gb) or GenPept (-format gp) flatfiles, which have features annotating particular regions of the sequence:

```
LOCUS       AAA81880                 501 aa            linear   PLN ... 
DEFINITION  lycopene cyclase [Arabidopsis thaliana].
ACCESSION   AAA81880
VERSION     AAA81880.1  GI:735882
DBSOURCE    locus ATHLYC accession L40176.1
KEYWORDS    .
SOURCE      Arabidopsis thaliana (thale cress)
ORGANISM    Arabidopsis thaliana
Eukaryota; Viridiplantae; Streptophyta; Embryophyta;
```
Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; Brassicales; Brassicaceae; Camelineae; Arabidopsis.

Searching and Filtering

Restricting Query Results

The current results can be refined by further term searching in Entrez (useful in the protein database for limiting BLAST neighbors to a taxonomic subset):

esearch -db pubmed -query "opsin gene conversion" |
elink -related |
efilter -query "tetrachromacy"

Results can also be filtered by time. For example, the following statements:

efilter -days 60 -datetype PDAT
efilter -mindate 1990 -maxdate 1999 -datetype PDAT

restrict results to articles published in the previous two months or in the 1990s, respectively.
Qualifying Queries by Indexed Field

Query terms in esearch or efilter can be qualified by entering an indexed field abbreviation in brackets. Boolean operators and parentheses can also be used in the query expression for more complex searches.

Commonly-used fields for PubMed queries include:

- [AFFL] Affiliation
- [ALL] All Fields
- [AUTH] Author
- [FAUT] Author - First
- [LAUT] Author - Last
- [PDAT] Date - Publication
- [FILT] Filter
- [JOUR] Journal
- [LANG] Language
- [MAJR] MeSH Major Topic
- [SUBH] MeSH Subheading
- [MESH] MeSH Terms
- [PTYP] Publication Type
- [WORD] Text Word
- [TITL] Title
- [TIAB] Title/Abstract
- [UID] UID

and a qualified query looks like:

"Tager HS [AUTH] AND glucagon [TIAB]"

Filters that limit search results to subsets of PubMed include:

- humans [MESH]
- pharmacokinetics [MESH]
- chemically induced [SUBH]
- all child [FILT]
- english [FILT]
- freetext [FILT]
- has abstract [FILT]
- historical article [FILT]
- randomized controlled trial [FILT]
- clinical trial, phase ii [PTYP]
- review [PTYP]

Sequence databases are indexed with a different set of search fields, including:

- [ACCN] Accession
- [ALL] All Fields
- [AUTH] Author
- [GPRJ] BioProject
- [ECNO] EC/RN Number
- [FKEY] Feature key
- [FILT] Filter
- [GENE] Gene Name
and a sample query in the protein database is:

"alcohol dehydrogenase [PROT] NOT (bacteria [ORGN] OR fungi [ORGN])"

Additional examples of subset filters in sequence databases are:

mammalia [ORGN]
mammalia [ORGN:noexp]
cds [FKEY]
lacz [GENE]
beta galactosidase [PROT]
protein snp [FILT]
reviewed [FILT]
biomol genomic [PROP]
dbxref flybase [PROP]
 gdbiv phg [PROP]
phylogenetic study [PROP]
sequence from mitochondrion [PROP]
src cultivar [PROP]
srccdb refseq validated [PROP]
150:200 [SLEN]
2000:4000 [MLWT]

(The calculated molecular weight (MLWT) field is only indexed for proteins (and structures), not nucleotides.)

Examining Intermediate Results

EDirect stores intermediate results on the Entrez history server. EDirect navigation functions produce a custom XML message with the relevant fields (database, web environment, query key, and record count) that can be read the next command in the pipeline.

The results of each step in a query can be examined to confirm expected behavior before adding the next step. The Count field in the ENTREZ_DIRECT object contains the number of records returned by the previous step. A good measure of query success is a reasonable (non-zero) count value. For example:
esearch -db protein -query "NP_567004 [ACCN]" |
elink -related |
efilter -query "28000:30000 [MLWT]" |
elink -target structure |
efilter -query "0:2 [RESO]"

produces:

<ENTREZ_DIRECT>
<Db>structure</Db>
<WebEnv>NCID_1_545606712_172.16.22.25_5555_1348089299_358182861</WebEnv>
<QueryKey>7</QueryKey>
<Count>39</Count>
<Step>5</Step>
</ENTREZ_DIRECT>

with 39 protein structures being within the specified molecular weight range and having the desired (X-ray crystallographic) atomic position resolution.

(The QueryKey value is 7 instead of 5 because each elink command obtains the record count by running a separate ESearch query immediately after the ELink operation.)

**Combining Independent Queries**

Independent esearch, elink, and efilter operations can be performed and then combined at the end by using the history server's "#" convention to indicate query key numbers. (The steps to be combined must be in the same database.) Subsequent esearch commands can take a -db argument to override the database piped in from the previous step. (Piping the queries together is necessary for sharing the same history thread.) For example, the query:

```bash
esearch -db protein -query "amyloid* [PROT]" |
elink -target pubmed |
esearch -db gene -query "apo* [GENE]" |
elink -target pubmed |
esearch -query "(#3) AND (#6)" |
efetch -format docsum |
xtract -pattern DocumentSummary -element Id Title
```

uses truncation searching (entering the beginning of a word followed by an asterisk) to return titles of papers with links to amyloid protein sequence and apolipoprotein gene records:

- 23962925 Genome analysis reveals insights into physiology and ...
- 23959870 Low levels of copper disrupt brain amyloid-β homeostasis ...
- 23371554 Genomic diversity and evolution of the head crest in the ...
- 23251661 Novel genetic loci identified for the pathophysiology of ...

The use of (#3) AND (#6) instead of (#2) AND (#4) above reflects the need for each elink command to execute a separate ESearch query, which increments the QueryKey, in order to obtain the record count. The -label argument can be used to get around this artifact.
The label value is prefixed by a "#" symbol and placed in parentheses in the final search. Thus:

```
esearch -db structure -query "insulin [TITL]" |
elink -target pubmed -label struc_cit |
esearch -db protein -query "insulin [PROT]" |
elink -target pubmed -label prot_cit |
esearch -query "(#struc_cit) AND (#prot_cit)" |
efetch -format uid
```

will return:

```
15299880
9235985
9141131
8421693
...
```

without the need to keep track of the internal QueryKey values.

**Structured Data**

**Advantages of XML Format**

The ability to obtain Entrez records in structured XML format, and to easily extract the underlying data, allows the user to ask novel questions that are not addressed by existing analysis software.

The advantage of XML is that many pieces of information are in specific locations in a well-defined data hierarchy. Accessing individual units of data that are fielded by name, such as:

```
<PubDate>2013</PubDate>
<Source>PLoS One</Source>
<Volume>8</Volume>
<Issue>3</Issue>
<Pages>e58144</Pages>
```

requires matching the same general pattern, differing only by the element name. This is much simpler than parsing the units from a long, complex string:

```
```

The disadvantage of XML is that data extraction usually requires programming. But EDirect relies on the common pattern of XML value representation to provide a simplified approach to interpreting XML data.

**Conversion of XML Data into Tabular Form**

The xtract function uses command-line arguments to direct the selective conversion of XML data into a tab-delimited table. The -pattern argument divides the results into rows, while placement of data into columns is controlled by -element. A trivial example:
Xtract provides control over data conversion with a divide-and-conquer strategy using separate arguments for element selection, path exploration, conditional processing, and report formatting.

Element selection finds every occurrence of each indicated item, printing values as they are encountered. Exploration control limits selection by context, presenting specified objects one at a time. Conditional processing filters by content, requiring presence (or absence) of a particular data value in order to continue. Finally, custom formatting can override the normal tabular layout of the default output.

The details and ramifications of this flexible approach are discussed in the remainder of this section.

**Extraction Arguments**

Selection arguments (-element, -first, and -last) extract and print data values from the indicated element names:

- **-element Id**
- **-first Name Title**

Exploration arguments (-pattern, -group, -block, and -subset) limit data extraction to specified regions of the XML, visiting all relevant objects one at a time. This sets a context for data collection, eliminates the need to provide the full path to a data element, and uncouples the concept of "what to look for" from "where to find it":

- **-pattern DocumentSummary**
- **-block Author**

Each pattern can have multiple groups, each group can have multiple blocks, and each block can have multiple subsets. This design allows nested exploration of complex, hierarchical data to be controlled by a linear chain of command-line argument statements.

Conditional processing arguments restrict exploration statements by object name and value (-if and -unless) or item location (-position):

- **-if Source -equals "J Bacteriol"**
- **-position first**

These commands are issued immediately after an exploration argument.

Formatting arguments (-ret, -tab, -sep, -pfx, -sfx, and -def) allow extensive customization of the default row/column table presentation:

- **-pfx 
  
- sfx \t -sep " " -tab "" -ret \n\n - def "-"**

and apply to subsequent selection statements.

(The "\n" escape sequence indicates a line break, while "\t" specifies a tab character.)
XML Document Summaries

Entrez provides a document summary in structured XML format for every record. Piping a query to "efetch -format docsum":

```bash
esearch -db pubmed -query "Garber ED [AUTH] AND PNAS [JOUR]" |
elink -related |
efilter -query "mouse" |
efetch -format docsum
```

will generate an XML document summary set:

```xml
<DocumentSummarySet status="OK">
  <DbBuild>Build150407-2207m.3</DbBuild>
  <DocumentSummary>
    <Id>19650888</Id>
    <PubDate>2009 Aug 3</PubDate>
    <EPubDate>2009 Aug 3</EPubDate>
    <Source>BMC Microbiol</Source>
    <Authors>
      <Author>
        <Name>Cano V</Name>
        <AuthType>Author</AuthType>
      </Author>
      <Author>
        <Name>Moranta D</Name>
        <AuthType>Author</AuthType>
      </Author>
      ...
    </Authors>
  </DocumentSummary>
</DocumentSummarySet>
```

Piping the document summary output to:

```bash
xtract -outline
```

will give an indented overview of the XML structure hierarchy:

```
DbBuild
  DocumentSummary
    Id
    PubDate
    EPubDate
    Source
    Authors
      Author
        Name
        AuthType
        ClusterID
      Author
        Name
        ...
```
The outline view presents a clear, uncluttered picture of the XML hierarchy that is useful in designing the appropriate command for actual data extraction. Copy and paste from the -outline output to xtract arguments can help avoid typographical errors. Thus:

```
esearch -db pubmed -query "Garber ED [AUTH] AND PNAS [JOUR]" |
elink -related |
efilter -query "mouse" |
efetch -format docsum |
xtract -pattern DocumentSummary -element Id SortFirstAuthor Title
```

returns the PubMed identifier (PMID), first author name, and article title:

<table>
<thead>
<tr>
<th>PMID</th>
<th>First Author</th>
<th>Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>19650888</td>
<td>Cano V</td>
<td>Klebsiella pneumoniae triggers a cytotoxic ...</td>
</tr>
<tr>
<td>19262028</td>
<td>Suto J</td>
<td>Metabolic consequence of congenital asplenia ...</td>
</tr>
<tr>
<td>19248821</td>
<td>Fukumoto N</td>
<td>Hypoalgesic behaviors of P/Q-type voltage- ...</td>
</tr>
<tr>
<td>18822497</td>
<td>Trishin AV</td>
<td>[Protective activity of secreted proteins of ...</td>
</tr>
<tr>
<td>18582214</td>
<td>Singh A</td>
<td>Generation and characterization of monoclonal ...</td>
</tr>
</tbody>
</table>

Using xtract "-synopsis" instead of -outline show the full path to each element. Piping those results to "sort-uniq-count" (see below) produces a table of unique path counts.

### Processing Results with UNIX Utilities

A tab-delimited table can be processed by many UNIX utilities. For example:

```
esearch -db pubmed -query "Garber ED [AUTH] AND PNAS [JOUR]" |
elink -related |
efilter -query "mouse" |
efetch -format docsum |
xtract -pattern DocumentSummary -element Id SortFirstAuthor Title |
sort -t $'	' -k 2,2f -k 3,3f
```

sorts the results of the previous example by author name and then (if there are multiple publications by the same author) alphabetically by title:

<table>
<thead>
<tr>
<th>PMID</th>
<th>First Author</th>
<th>Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>17474906</td>
<td>Benghezal M</td>
<td>Inhibitors of bacterial virulence ...</td>
</tr>
<tr>
<td>19650888</td>
<td>Cano V</td>
<td>Klebsiella pneumoniae triggers a cytotoxic ...</td>
</tr>
<tr>
<td>17102561</td>
<td>Chatterjee S</td>
<td>How reliable are models for malaria vaccine ...</td>
</tr>
<tr>
<td>17371870</td>
<td>Clements A</td>
<td>Secondary acylation of Klebsiella ...</td>
</tr>
<tr>
<td>17142396</td>
<td>Fresno S</td>
<td>A second galacturonic acid transferase is ...</td>
</tr>
<tr>
<td>16735743</td>
<td>Fresno S</td>
<td>The ionic interaction of Klebsiella ...</td>
</tr>
</tbody>
</table>

Rather than always having to retype a series of common post-processing instructions, frequently used combinations of UNIX commands can be placed in a function, stored in an alias file (e.g., the user’s .bash_profile), and executed by name. (The following two functions are now included as scripts with the EDirect software.) For example:

```
WordAtATime() {
    sed 's/[^a-zA-Z0-9]/ /g; s/^ */// |
    tr 'A-Z' 'a-z' |
    fmt -w 1
}
```
Titles can be passed to a pair of these UNIX alias commands:

```bash
esearch -db pubmed -query "Casadaban transposition immunity" |
elink -related |
efetch -format docsum |
xtract -pattern DocumentSummary -element Title |
word-at-a-time |
sort-uniq-count-rank
```

to generate a table of word occurrence counts, sorted by frequency:

```
296    of
175    the
114    transposition
102    and
94     in
93     mu
83     a
61     dna
61     tn3
55     transposon
...
```

### Output Format Customization

The line break between `-pattern` objects can be overridden with `-ret`, and the tab character between fields can be replaced by `-tab`.

The `-sep` argument is used to distinguish multiple elements of the same type and control their separation independently of the `-tab` argument. For example:

```bash
esearch -db gene -query "deuteranopia" |
efetch -format xml |
xtract -pattern Entrezgene \ 
  -element Gene-track_geneid Gene-ref_locus \ 
  -sep "|" -element Gene-ref_syn_E
```

combines all synonyms for a gene into a single column, separated by vertical bars:

```
2652    OPN1MW    CBD|GCP|GOP|CBBM|COD5|OPN1MW1
5956    OPN1LW    CBP|RCP|ROP|CBBM|COD5
```
The -sep value also applies to unrelated -element items that are grouped with commas. Otherwise the -tab value delineates individual fields.

Groups or fields are preceded by the -pfx value and followed by the -sfx value, both of which are initially empty.

Missing data values can be marked by the -def argument. For example:

```
esearch -db pubmed -query "deuteranopia" |
efetch -format xml |
xtract -pattern PubmedArticle -def "-" \
   -first MedlineCitation/PMID Author/LastName Keyword
```

inserts a dash in a column where the specified element is missing.

**Pubmed Article XML Records**

The PubmedArticle object (for -db pubmed) has a more detailed structure than the DocumentSummary:

```
esearch -db pubmed -query "tetrachromacy" |
efetch -format xml |
xtract -outline
```

More information is fielded, including author names, dates, and the abstract:

```
PubmedArticle
   MedlineCitation
      PMID
      DateCreated
         Year
         Month
         Day
      DateCompleted
         Year
         Month
         Day
      DateRevised
         Year
         Month
         Day
      Article
         Journal
            ISSN
         JournalIssue
            Volume
            Issue
            PubDate
               Year
               Month
               Day
         Title
         ISOAbbreviation
```
Using this information to craft a new xtract statement:

```
esearch -db pubmed -query "tetrachromacy" |
efetch -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID LastName
```

results in a table of all authors for each record:

```
23393278    Sabbah       Troje        Gray        Hawryshyn
20884587    Jordan       Deeb         Bosten      Mollon
18230593    Koshitaka    Kinoshita    Vorobyev    Arikawa
17685813    Wachtler     Doi          Lee         Sejnowski
16086150    Goldsmith    Butler       
...
```

(Note that "-element MedlineCitation/PMID" uses the "Parent/Child" construct to prevent the display of additional PMID items that may occur later in CommentsCorrections objects.)

The -first or -last arguments can be used instead of -element, if appropriate.

**Exploration of XML Sets**

Individual PubmedArticle objects can be retrieved directly by efetch:

```
efetch -db pubmed -id 20643751 -format xml
```

The resulting XML has authors with separate fields for last name and initials:

```
...<AuthorList>
  <Author>
    <LastName>Inamdar</LastName>
    <ForeName>Arati A</ForeName>
    <Initials>AA</Initials>
  </Author>
...```
Without being given any guidance about context, an -element statement with "Initials" and "LastName" arguments:

```
efetch -db pubmed -id 1413997,6301692,781293 -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID \ 
  -element Initials LastName
```

will explore the current record for each argument separately, and thus print all author initials followed by all author last names:

```
1413997    RK    CR           JS         Mortimer      Contopoulou    King
6301692    MA    NR           Krasnow    Cozzarelli
781293     MJ    Casadaban
```

Inserting a -block statement redirects data exploration to present each author one at a time. Subsequent -element statements only see the current author's values:

```
efetch -db pubmed -id 1413997,6301692,781293 -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID \ 
  -block Author -element Initials LastName
```

which restores the correct association of initials and last name:

```
1413997    RK    Mortimer     CR    Contopoulou    JS    King
6301692    MA    Krasnow      NR    Cozzarelli
781293     MJ    Casadaban
```

Adding a -sep statement to replace the normal tab between group members, and using a comma to combine the two arguments ("Initials,LastName") into a group:

```
efetch -db pubmed -id 1413997,6301692,781293 -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID \ 
  -block Author -sep " " -element Initials,LastName
```

results in more desirable formatting of author names:

```
1413997    RK Mortimer     CR Contopoulou    JS    King
6301692    MA Krasnow      NR Cozzarelli
781293     MJ Casadaban
```
Exploring Separate XML Regions

Multiple -block statements can be used in a single xtract to explore different areas of the XML. This limits element extraction to the desired subregions, and allows disambiguation of fields with identical names.

Combining independent fields with commas allows them to be treated as sets. The tab that normally separates these can be replaced with a -sep argument:

```
efetch -db pubmed -id 6092233,4640931,4296474 -format xml |
  xtract -pattern PubmedArticle -element MedlineCitation/PMID |
  -block AuthorList -sep "/" -element LastName ">#Author" |
  -block PubDate -sep " " -element Year,Month MedlineDate |
  -block DateCreated -sep "-" -element Year,Month,Day |
  sort -t $'\t' -k 3,3n -k 2,2f
```

This generates a table that allows easy parsing of author last names, counts the number of authors present, and prints the date each record was published and the date it was entered into PubMed, sorting the results by author count:

```
4296474    Friedmann                        1    1968 Apr        1968-06-05
4640931    Tager/Steiner                    2    1972 Dec        1973-02-15
6092233    Calderon/Contopoulou/Mortimer    3    1984 Jul-Aug    1984-12-13
```

(Note that the PubDate object can exist either in a structured form:

```
<PubDate>
  <Year>1968</Year>
  <Month>Apr</Month>
  <Day>25</Day>
</PubDate>
```

(with the Day field frequently absent), or in a string form:

```
<PubDate>
  <MedlineDate>1984 Jul-Aug</MedlineDate>
</PubDate>
```

but would not contain a mixture of both types, so the directive:

```
  -element Year,Month MedlineDate
```

will only contribute a single column to the output.)

Nested Exploration of Subsets Within XML Sets

Medical Subject Headings (MeSH terms) in a record may be assigned subheadings:

```
...  
  <MeshHeading>
    <DescriptorName>RNA, Messenger</DescriptorName>
    <QualifierName>genetics</QualifierName>
  </MeshHeading>
```

Entrez Direct: E-utils on the UNIX Command Line 83
Visiting each MeSH term with a -block statement, and adding a -subset statement within the -block, allows nested exploration of the subheadings for the current MeSH term:

```
efetch -db pubmed -id 6162838 -format xml |
xtract -pattern PubmedArticle -tab "" -element MedlineCitation/PMID |
   -block MeshHeading -pfx "\n" -tab "" -element DescriptorName |
      -subset QualifierName -pfx " / " -tab "" -element QualifierName
```

and creates a list of MeSH terms with associated subheadings:

```
6162838
Base Sequence
DNA, Recombinant
Escherichia coli / genetics
... 
RNA, Messenger / genetics
Transcription, Genetic
beta-Galactosidase / genetics / metabolism
```

**Selection of Attributes**

The MeSH term and subheading fields actually have major topic attributes:

```
... 
<MeshHeading>
   <DescriptorName MajorTopicYN="N">beta-Galactosidase</DescriptorName>
   <QualifierName MajorTopicYN="Y">genetics</QualifierName>
   <QualifierName MajorTopicYN="N">metabolism</QualifierName>
</MeshHeading>
... 
```

that can be selected as "DescriptorName@MajorTopicYN" or "@MajorTopicYN":

```
efetch -db pubmed -id 6162838 -format xml |
xtract -pattern PubmedArticle -tab "" -element MedlineCitation/PMID |
   -block MeshHeading -pfx "\n" -sep "|" -tab "" |
      -element DescriptorName@MajorTopicYN,DescriptorName |
      -subset QualifierName -pfx " / " -sep "|" -tab "" |
         -element @MajorTopicYN,QualifierName
```

The major topic value is placed before each MeSH term or subheading:

```
6162838
N|Base Sequence
```
The results can be processed by the UNIX stream editor "sed":

```
sed -e 's/N|//g' -e 's/Y|/*/g'
```

to display an asterisk for major ("starred" MeSH term) concepts:

```
6162838
Base Sequence
*DNA, Recombinant
Escherichia coli / genetics
...
RNA, Messenger / *genetics
Transcription, Genetic
beta-Galactosidase / *genetics / metabolism
```

### Recording Values in Variables

A value can be recorded in a variable and then displayed multiple times as needed. Variables are indicated by a hyphen followed by a string of capital letters or digits. The variable "-PMID" is referred to as "&PMID" in an -element argument. For example:

```
efetch -db pubmed -id 1413997,6301692,781293 -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID |
  -block Author -element "&PMID" | -block Author -element Initials,LastName
```

produces a list of authors, with the PMID in the first column of each row:

```
1413997    RK Mortimer
1413997    CR Contopoulou
1413997    JS King
6301692    MA Krasnow
6301692    NR Cozzarelli
781293     MJ Casadaban
```

### Variable Initialization

Variables can be initialized with a literal value in parentheses:

```
efetch -db pubmed -id 1413997,6301692,781293 -format xml |
xtract -pattern PubmedArticle -element MedlineCitation/PMID |
  -block Author -element Initials,LastName -COM "(, )"
```

This can be used as a placeholder to prevent missing data from shifting columns in a table, or to have additional control over output formatting:
All variables are reset when the next record is processed.

**Conditional Processing**

Xtract provides -if and -unless arguments that filter by element name or name plus data value. For example:

```bash
esearch -db pubmed -query "Cozzarelli NR [AUTH]" |
efetch -format xml |
xtract -pattern PubmedArticle -if "#Author" -eq 3 | -block Author -if LastName -is-not Cozzarelli |
-sep ", " -tab "\n" -element LastName,Initials |
sort | uniq
```

will select papers with exactly 3 authors and print the coauthor names:

```
Ackerman, RS
Adams, DE
Alexandrov, AI
Arimondo, PB
Bauer, WR
...
```

Multiple conditions are specified with -and and -or commands:

```
-if @score -equals 1 -or @score -starts-with 0.9
```

The -else command can supply alternative -element or -lbl instructions to be run if the condition is not satisfied:

```
-if MapLocation -element MapLocation -else -lbl "\-"
```

Parallel -if and -unless statements can be used to provide a more complex response to alternative conditions that includes nested exploration.

**Sequence Records**

**NCBI Data Model for Sequence Records**

The NCBI represents sequence records in a data model that is based on the central dogma of molecular biology. Sequences, including genomic DNA, messenger RNAs, and protein products, are "instantiated" with the actual sequence letters, and are assigned identifiers (e.g., accession numbers) for reference. Features carry information about the biology of a given region, with a location that refers to specific intervals on a particular sequence. Some features may also point to the product sequence of a particular transformation.
A gene feature indicates the location of a heritable region of nucleic acid that confers a measurable phenotype. An mRNA feature on genomic DNA represents the exonic and untranslated regions of the message that remain after transcription and splicing. A coding region (CDS) feature has a product reference to the translated protein.

Since messenger RNA sequences are not always submitted with a genomic region, CDS features (which model the travel of ribosomes on transcript molecules) are traditionally annotated on the genomic sequence, with locations that encode the exonic intervals.

Features display specific biological annotation in qualifiers. For example, the name of a gene is shown in the /gene qualifier. A qualifier can be dynamically generated from...
underlying data for the convenience of the user. Thus, the sequence of a mature peptide may be extracted from the mat_peptide feature's location on the precursor protein and displayed in a /peptide qualifier, even if a mature peptide is not instantiated.

**Sequence Records in INSDSeq XML**

Sequence records can be retrieved in an XML version of the GenBank or GenPept flatfile. The query:

```
efetch -db protein -id 26418308,26418074 -format gpc
```

returns a set of INSDSeq objects:

```
<INSDSet>
  <INSDSeq>
    <INSDSeq_locus>AAN78128</INSDSeq_locus>
    <INSDSeq_length>17</INSDSeq_length>
    <INSDSeq_moltype>AA</INSDSeq_moltype>
    <INSDSeq_topology>linear</INSDSeq_topology>
    <INSDSeq_division>INV</INSDSeq_division>
    <INSDSeq_update-date>03-JAN-2003</INSDSeq_update-date>
    <INSDSeq_create-date>10-DEC-2002</INSDSeq_create-date>
    <INSDSeq_definition>alpha-conotoxin ImI precursor, partial [Conus imperialis]</INSDSeq_definition>
    <INSDSeq_primary-accession>AAN78128</INSDSeq_primary-accession>
    <INSDSeq_accession-version>AAN78128.1</INSDSeq_accession-version>
    <INSDSeq_other-seqids>
      <INSDSeqid>gb|AAN78128.1|</INSDSeqid>
      <INSDSeqid>gi|26418308</INSDSeqid>
    </INSDSeq_other-seqids>
    <INSDSeq_source>Conus imperialis</INSDSeq_source>
    <INSDSeq_organism>Conus imperialis</INSDSeq_organism>
    <INSDSeq_taxonomy>Eukaryota; Metazoa; Lophotrochozoa; Mollusca; Gastropoda; Caenogastropoda; Hypsogastropoda; Neogastropoda; Conoidea; Conidae; Conus</INSDSeq_taxonomy>
  </INSDSeq>
</INSDSet>
```

**INSDSeq XML presents biological features and qualifiers (shown here in GenPept format):**

<table>
<thead>
<tr>
<th>FEATURE</th>
<th>Location/Qualifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>1..17 /organism=&quot;Conus imperialis&quot; /db_xref=&quot;taxon:35631&quot; /country=&quot;Philippines&quot;</td>
</tr>
<tr>
<td>Protein</td>
<td>&lt;1..17 /product=&quot;alpha-conotoxin ImI precursor&quot;</td>
</tr>
<tr>
<td>mat_peptide</td>
<td>5..16 /product=&quot;alpha-conotoxin ImI&quot; /note=&quot;the C-terminal glycine of the precursor is post translationally removed&quot;</td>
</tr>
</tbody>
</table>
in a structured feature table:

```
...<INSDFeature>
  <INSDFeature_key>mat_peptide</INSDFeature_key>
  <INSDFeature_location>5..16</INSDFeature_location>
  <INSDFeature_intervals>
    <INSDInterval>
      <INSDInterval_from>5</INSDInterval_from>
      <INSDInterval_to>16</INSDInterval_to>
      <INSDInterval_accession>AAN78128.1</INSDInterval_accession>
    </INSDInterval>
  </INSDFeature_intervals>
  <INSDFeature_quals>
    <INSDQualifier>
      <INSDQualifier_name>product</INSDQualifier_name>
      <INSDQualifier_value>alpha-conotoxin ImI</INSDQualifier_value>
    </INSDQualifier>
    <INSDQualifier>
      <INSDQualifier_name>note</INSDQualifier_name>
      <INSDQualifier_value>the C-terminal glycine of the precursor is
         post translationally removed</INSDQualifier_value>
    </INSDQualifier>
    <INSDQualifier>
      <INSDQualifier_name>calculated_mol_wt</INSDQualifier_name>
      <INSDQualifier_value>1357</INSDQualifier_value>
    </INSDQualifier>
    <INSDQualifier>
      <INSDQualifier_name>peptide</INSDQualifier_name>
      <INSDQualifier_value>GCCSDPRCAWRC</INSDQualifier_value>
    </INSDQualifier>
  </INSDFeature_quals>
</INSDFeature>
...```

Feature and qualifier names are indicated in data values, not XML element tags, and require -if and -equals to select the desired object and content. The xtract -insd argument simplifies this process, as shown below.

**Generating Qualifier Extraction Commands**

Because obtaining specific qualifier values from INSDSeq XML is somewhat more complex than previous cases, the xtract -insd argument can be used to generate extraction instructions.
Running xtract -insd in an isolated command prints a new xtract statement that can then be copied, edited if necessary, and pasted into other queries. Running the -insd command within a multi-step pipe dynamically executes the constructed query.

Providing an optional (complete/partial) location indication, a feature key, and then one or more qualifier names:

```
xtract -insd complete mat_peptide "%peptide" product peptide
```

creates a new xtract statement that will produce a table of qualifier values from mature peptide features with complete locations. The statement starts with instructions to record the accession and find features of the indicated type:

```
xtract -pattern INSDSeq -ACCN INSDSeq_accession-version 
- group INSDFeature -if INSDFeature_key -equals mat_peptide 
- unless INSDFeature_partial5 -or INSDFeature_partial3 
- clr -pfx "\n" -element "&ACCN"
```

Each qualifier then generates custom extraction code that is appended to the growing query. For example:

```
-block INSDQualifier 
- if INSDQualifier_name -equals peptide 
- element INSDQualifier_value
```

Incorporating the xtract -insd command in a query for marine snail venom peptides:

```
eselect -db pubmed -query "conotoxin" | 
elink -target protein | 
efilter -query "mat_peptide [FKEY]" | 
efetch -format gpc | 
xtract -insd complete mat_peptide "%peptide" product peptide
```

produces a table with columns for accession number, calculated peptide length, product name, and peptide sequence:

```
AGO59814.1    32    del13b conotoxin       DCPTSCPTTCANGWECKGYPCVRQHCNCNH
AAO33169.1    16    alpha-conotoxin GIC    GCCSHPGACAGNNQHIC
ADB65788.1    20    conotoxin Cal 16       LEMQGCVCNANAKFCCGGEGR
AAN78128.1    12    alpha-conotoxin ImI     GCSCDFPRCAWRC
AAF31671.1    31    BeTX toxin             CRAEGTYCENDSQCCLNECCWGGCGHCRHP
ADB5789.1     20    conotoxin Cal 16       LEMQGCVCNANAKFCCGGEGR
AAN78279.1    21    conotoxin Vx-II        WIDPSHYCCCCGCTDDCVNC
ABW16858.1    15    marmophin              DWYHAYHPKNSF
...
```

Piping the results to a series of UNIX commands:

```
grep -i conotoxin | 
awk -F 't' -v 'OPS=\t' '(if ( 10 <= $2 && $2 <= 30 ) print)' | 
sort -t $'\t' -u -k 3,4 | 
sort -t $'\t' -k 2,2n -k 3,3f | 
cut -f 1,3- | 
column -s $'\t' -t
```
filters by product name, limits the results to a specified range of peptide lengths, removes redundant accessions, sorts the table by peptide length, deletes the length column, and aligns the columns for cleaner printing:

<table>
<thead>
<tr>

</tbody>
</table>

For records where a particular qualifier is missing:

```
esearch -db protein -query "RAG1 [GENE] AND Mus musculus [ORGN]" | 
efetch -format gpc | 
xtract -insd source organism strain | 
sort -t $'\t' -u -k 2,3
```

a dash is inserted as a placeholder:

```
P15919.2         Mus musculus       -
AAO61776.1       Mus musculus       129/Sv
NP_033045.2       Mus musculus       C57BL/6
XP_006499075.1   Mus musculus       C57BL/6J
EDL27655.1       Mus musculus       mixed
BAD69530.1       Mus musculus castaneus -
BAD69531.1       Mus musculus domesticus BALB/c
BAD69532.1       Mus musculus molossinus MOA
...
Sequence Coordinates

Gene Positions

An understanding of sequence coordinate conventions is necessary in order to use gene positions to retrieve the corresponding chromosome subregion with efetch or with the UCSC browser.

Sequence records displayed in GenBank or GenPept formats use a "one-based" coordinate system, with sequence position numbers starting at "1":

```
1 catgccattc gttgagttgg aaacaaactt gccggctagc cgcatacccg cggggctgga
61 gaaccggctg tgtgcggcca cagccaccat cctggacaaa cccgaagacg tgagtgaggg
121 tcggcgagaa cttgtgggct agggtcggac ctcccaatga cccgttccca tccccaggga
181 ccccactccc ctggtaacct ctgaccttcc gtgtcctatc ctccccctct ctcccccttc agatcccttc...
```

Under this convention, positions refer to the sequence letters themselves:

```
C   A   T   G   C   C   A   T   T   C
1   2   3   4   5   6   7   8   9  10
```

and the position of the last base or residue is equal to the length of the sequence. The ATG initiation codon above is at positions 2 through 4, inclusive.

For computer programs, however, using "zero-based" coordinates can simplify the arithmetic used for calculations on sequence positions. The ATG codon in the 0-based representation is at positions 1 through 3. (The UCSC browser uses a hybrid, half-open representation, where the start position is 0-based and the stop position is 1-based.)

Software at NCBI will typically convert positions to 0-based coordinates upon input, perform whatever calculations are desired, and then convert the results to a 1-based representation for display. These transformations are done by simply subtracting 1 from the 1-based value or adding 1 to the 0-based value.

Coordinate Conversions

Retrieving the docsum for a particular gene:

```
esearch -db gene -query "BRCA2 [GENE] AND human [ORGN]" | efetch -format docsum
```

returns the chromosomal position of that gene in 0-based coordinates:

```
...</GenomicInfoType>
<ChrLoc>13</ChrLoc>
<ChrAccVer>NC_000013.11</ChrAccVer>
<ChrStart>32315479</ChrStart>
<ChrStop>32399671</ChrStop>
<ExonCount>27</ExonCount>
```
Piping the document summary to an xtract command:

```bash
xtract -pattern GenomicInfoType -element ChrAccVer ChrStart ChrStop
```

obtains the accession and 0-based coordinate values:

```
NC_000013.11    32315479    32399671
```

EFetch has -seq_start and -seq_stop arguments to retrieve a gene segment, but these expect the sequence subrange to be in 1-based coordinates.

To address this problem, two additional efetch arguments, -chr_start and -chr_stop, allow direct use of the 0-based coordinates:

```bash
efetch -db nuccore -format gb -id NC_000013.11 -chr_start 32315479 -chr_stop 32399671
```

and eliminate the need for writing a UNIX shell command to increment the two values.

Xtract has numeric extraction commands to assist with coordinate conversion. Selecting fields with an -inc argument:

```bash
xtract -pattern GenomicInfoType -element ChrAccVer -inc ChrStart ChrStop
```

obtains the accession and 0-based coordinates, then increments the positions to produce 1-based values:

```
NC_000013.11    32315480    32399672
```

EDirect knows the policies for sequence positions in all relevant Entrez databases (e.g., gene, snp, dbvar), and provides additional shortcuts for converting these to other conventions. For example:

```bash
xtract -pattern GenomicInfoType -element ChrAccVer -1-based ChrStart ChrStop
```

understands that gene ChrStart and ChrStop fields are 0-based, sees that the desired output is 1-based, and translates the command to convert coordinates using the -inc argument. Similarly:

```bash
xtract -pattern GenomicInfoType -element ChrAccVer -ucsc-based ChrStart ChrStop
```

leaves the 0-based start value unchanged but increments the original stop value to produce the half-open form that can be passed to the UCSC browser:

```
NC_000013.11    32315479    32399672
```

**Complex Objects**

**Heterogeneous Data**

XML objects can contain a heterogeneous mix of components. For example:
efetch -db pubmed -id 21433338,17247418 -format xml

returns a mixture of book and journal records:

```xml
<PubmedArticleSet>
  <PubmedBookArticle>
    <BookDocument> ...
    </PubmedBookData>
  </PubmedBookArticle>
  <PubmedArticle>
    <MedlineCitation> ...
    </PubmedData>
  </PubmedArticle>
</PubmedArticleSet>
```

The "Parent/*" construct is used to visit the individual components, even though they may have different names. Piping the XML output to:

```bash
xtract -pattern "PubmedArticleSet/*" -element "*"
```

separately prints the entirety of each XML component:

```xml
<PubmedBookArticle><BookDocument> ... </PubmedBookData></PubmedBookArticle>
<PubmedArticle><MedlineCitation> ... </PubmedData></PubmedArticle>
```

Use of the "Parent/Child" construct can isolate objects of the same name that differ by their location in the XML hierarchy. For example:

```bash
efetch -db pubmed -id 21433338,17247418 -format xml |
xtract -pattern "PubmedArticleSet/*" \ 
  -group "BookDocument/AuthorList" -tab "\n" -element LastName \ 
  -group "Book/AuthorList" -tab "\n" -element LastName \ 
  -group "Article/AuthorList" -tab "\n" -element LastName
```

writes separate lines for book/chapter authors, book editors, and article authors:

```
Fauci        Desrosiers
Coffin       Hughes        Varmus
Lederberg    Cavalli       Lederberg
```

Simply exploring with individual arguments:

```bash
  -group BookDocument -block AuthorList -element LastName
```

would visit the editors (at BookDocument/Book/AuthorList) as well as the authors (at BookDocument/AuthorList), and print names in order of appearance in the XML:

```
Coffin       Hughes        Varmus       Fauci        Desrosiers
```

(In this particular example the book author lists could be distinguished by using -if "@Type" -equals authors or -if "@Type" -equals editors, but exploring by "Parent/Child" is a general position-based approach.)
Recursive Definitions

Certain XML objects returned by efetch are recursively defined, including Taxon in TaxaSet (-db taxonomy) and Gene-commentary in Entrezgene (-db gene). Thus, they can have nested objects with the same XML tag.

Retrieving a set of taxonomy records:

```
  efetch -db taxonomy -id 9606,7227 -format xml
```

produces XML with nested Taxon objects (marked below with line references) for each rank in the taxonomic lineage:

```
<TaxaSet>
  <Taxon>
    <TaxId>9606</TaxId>
    <ScientificName>Homo sapiens</ScientificName>
    ...
    <LineageEx>
      <Taxon>
        <TaxId>131567</TaxId>
        <ScientificName>cellular organisms</ScientificName>
        <Rank>no rank</Rank>
      </Taxon>
      <Taxon>
        <TaxId>2759</TaxId>
        <ScientificName>Eukaryota</ScientificName>
        <Rank>superkingdom</Rank>
      </Taxon>
    </LineageEx>
  </Taxon>
  ...
  ...
  <Taxon>
    <TaxId>7227</TaxId>
    <ScientificName>Drosophila melanogaster</ScientificName>
    ...
  </Taxon>
</TaxaSet>
```

Xtract tracks XML object nesting to determine that the <Taxon> start tag on line 1 is actually closed by the </Taxon> stop tag on line 6, and not by the first </Taxon> encountered on line 3.

When a recursive object is given to an exploration command, selection of data using the -element command:

```
efetch -db taxonomy -id 9606,7227,10090 -format xml |
xtract -pattern Taxon \
  -element TaxId ScientificName GenbankCommonName Division
```
does not examine fields in the internal objects, and returns information only for the main entries:

<table>
<thead>
<tr>
<th>TaxId</th>
<th>Scientific Name</th>
<th>Common Name</th>
<th>Taxonomic Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>9606</td>
<td>Homo sapiens</td>
<td>human</td>
<td>Primates</td>
</tr>
<tr>
<td>7227</td>
<td>Drosophila melanogaster</td>
<td>fruit fly</td>
<td>Invertebrates</td>
</tr>
<tr>
<td>10090</td>
<td>Mus musculus</td>
<td>house mouse</td>
<td>Rodents</td>
</tr>
</tbody>
</table>

The "*/Child" construct will skip past the outer start tag:

```bash
efetch -db taxonomy -id 9606,7227,10090 -format xml | xtract -pattern Taxon -block "*/Taxon" \ -tab "\n" -element TaxId,ScientificName
to visit the next level of nested objects individually:
```

<table>
<thead>
<tr>
<th>TaxId</th>
<th>Scientific Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>131567</td>
<td>cellular organisms</td>
</tr>
<tr>
<td>2759</td>
<td>Eukaryota</td>
</tr>
<tr>
<td>33154</td>
<td>Opisthokonta</td>
</tr>
</tbody>
</table>

Recursive objects can be fully explored with a double-star-slash prefix:

```bash
esearch -db gene -query "DMD [GENE] AND human [ORGN]" | efetch -format xml | xtract -pattern Entrezgene -block "*/Gene-commentary" \ -tab "\n" -element Gene-commentary_type@value,Gene-commentary_accession
```

which visits every child object regardless of nesting depth:

<table>
<thead>
<tr>
<th>Type</th>
<th>Accession</th>
</tr>
</thead>
<tbody>
<tr>
<td>genomic</td>
<td>NC_000023</td>
</tr>
<tr>
<td>mRNA</td>
<td>XM_006724469</td>
</tr>
<tr>
<td>peptide</td>
<td>XP_006724532</td>
</tr>
<tr>
<td>mRNA</td>
<td>XM_011545467</td>
</tr>
<tr>
<td>peptide</td>
<td>XP_011543769</td>
</tr>
</tbody>
</table>

**Advanced Topics**

**Storing Common Phrases in Alias Files**

Long or complicated search phrases can be saved in a file to avoid having to retype (or copy and paste) the full text for each query. Each line of the file has a shortcut keyword, a tab character, and the expanded search term. Shortcuts are referenced by placing them in parentheses after prefixing with a pound ("#") sign.

For example, given a file named "q_aliases" containing:

```
jour_filt    [MULT] AND ncbijournals [FILT]
trans_imm    (transposition OR target) immunity
```

the esearch line in:

```bash
esearch -alias q_aliases -db nlmcatalog -query "Science (#jour_filt)" | efetch -format docsum |
```
xtract -pattern DocumentSummary -element ISOAbbreviation \ 
-subset ISSNInfo -sep "|" -element issn,issntype

will be expanded to:

esearch -db nlmcatalog -query "Science [MULT] AND ncbijournals [FILT]"

with the query producing:

J. Zhejiang Univ. Sci.    1009-3095|Print    1009-3095|Linking
Science (80- )            0193-4511|Print    0193-4511|Linking
Science                   0036-8075|Print    1095-9203|Electronic    ...

An alias file can also be read in a separate instruction at the beginning of a pipeline or script:

eproxy -alias q_aliases

For maximum flexibility, separate eproxy commands can be piped together to load multiple shortcut files, as long as the shortcut strings are all unique.

Additional EDirect Options

ESearch and EFilter can be given a -sort argument to specify the order of results when the records are retrieved:

esearch -db pubmed -query "opsin gene conversion" -sort "last author" |
    efetch -format docsum |
    xtract -pattern DocumentSummary -element Id LastAuthor PubDate Title

ELink can return links to the citation list using ":-name pubmed_pubmed_citedin", but only for publications with full text deposited in PubMed Central (PMC). For example, the query:

esearch -db pubmed -query "Beadle GW [AUTH]" |
    elink -related -name pubmed_pubmed_citedin |
    efetch -format docsum |
    xtract -pattern Author -element Name |
    sort-uniq-count-rank |
    head -n 10

produces a ranked list of the ten most cited authors:

13    Beadle GW
 8     Ephrussi B
 8     Glass NL
 7     Hawley RS
 7     Mitchell MB
 7     PERKINS DD
 7     Tatum EL
 6     Mitchell HK
 6     YANOFSKY C
 5     Langley CH
Similarly, "-name pubmed_pubmed_refs" returns an article's reference list, again for publications deposited in PMC.

ELink has several command modes, and these can be specified with the -cmd argument. When not using the default "neighbor_history" command, elink will return an ELinkResult XML object, with the links for each UID presented in separate blocks. For example:

```
esearch -db pubmed -query "Hoffmann PC [AUTH] AND dopamine [MAJR]" |
elink -related -cmd neighbor |
xtract -pattern LinkSetDb -element Id
```

will show the original PMID in the first column and related article PMIDs in subsequent columns:

```
1504781  11754494  3815119  1684029  14614914  12128255  ...
1684029  3815119  1504781  8097798  17161385  14755628  ...
2572612  2903614  6152036  2905789  9483560  1352865  ...
...
```

When the elink command "prlinks" is used with "ref" mode, it can obtain HTML containing or referencing full text articles directly from the publishers. The UNIX "xargs" command calls elink separately for each identifier:

```
epost -db pubmed -id 22966225,19880848 |
efilter -query "freetext [FILT]" |
efetch -format uid |
xargs -n 1 elink -db pubmed -cmd prlinks -mode ref -http get -id
```

The elink -batch flag will bypass the Entrez history mechanism for large queries.

**Xtract Special Topics**

Self-closing tags of the standard form:

```
<Na-strand/>
```

or alternative form:

```
<Na-strand></Na-strand>
```

have no text content and thus cannot be selected with an -element command. If the tag contains an attribute:

```
<Seq-interval_strand>
  <Na-strand value="plus"/>
</Seq-interval_strand>
```

it can be selected by matching on the specified value:

```
-group Seq-interval_strand \ 
  -block Seq-interval_strand -if Na-strand@value -equals plus -lbl "+" \ 
  -block Seq-interval_strand -if Na-strand@value -equals minus -lbl "-"
```
The -pattern, -group, -block, and -subset commands provide a nested hierarchy of loop organizers for exploration of XML objects. Each pattern can contain multiple groups, each group can encompass multiple blocks, and each block can have multiple subsets.

Use of different argument names allows a linear representation of loop nesting, and provides sufficient flexibility to identify and extract arbitrary data from XML records in Entrez.

Sketching in pseudo code can clarify relative nesting levels. The extraction command:

```bash
xtract -pattern PubmedArticle \  
  -block Author -element Initials,LastName \  
  -block MeshHeading \  
    -if QualifierName \  
      -element DescriptorName \  
        -subset QualifierName -element QualifierName
```

could be represented as a computer program in pseudo code by:

```plaintext
for each Pubmed record {
  for each Author {
    print Initials LastName
  }
  for each MeSH term {
    if Subheadings are present {
      print Term Name
      for each Subheading {
        print Subheading Name
      }
    }
  }
}
```

Extra arguments (-division, -branch, -section, and -unit) are held in reserve to provide additional levels of organization, should the need arise in the future for processing complex, deeply-nested XML data. The full set of commands, in order of rank, are:

- pattern
- division
- group
- branch
- block
- section
- subset
- unit

Starting `xtract` exploration with -block, and expanding with -group and -subset, leaves additional level names that can be used wherever needed without having to redesign the entire command.
Querying External Web Services

The EDirect nquire function can be used to obtain data from an arbitrary URL. Queries are built up from command-line arguments. For example:

```
   -db pubmed -term insulin
```

reads the URL and then tag/value pairs to generate an E-utilities query:

```
```

Paths can be separated into components, which are combined with slashes, so:

```
```

is converted to:

```
```

Multiple values between tags are combined with commas. Thus:

```
-db nuccore -id U54469,V00328 -rettype fasta
```

is transformed into:

```
db=nuccore&id=U54469,V00328&rettype=fasta
```

A value that starts with a hyphen (or minus sign) can be distinguished from a tag by prefixing it with a backslash, so:

```
nquire -url http://api.geonames.org/countryCode -lat 41.796 -lng "\-87.577"
```

will be sent as:

```
http://api.geonames.org/countryCode?lat=41.796&lng=-87.577
```

and will return "US" for coordinates within Chicago, which has a negative (western hemisphere) longitude value.

The -alias argument can read a file of shortcut keywords and URL aliases. The following aliases are always available:

```
```

so the command:

```
nquire -url "(#eutils_url)" esearch.fcgi \
   -db gds -term "GSE22309 [ACCN] AND gse [ETYP]" -retmax 200
```

will run an ESearch query and return an eSearchResult XML object.

Raw XML with inconsistent line-wrapping and indentation can be reformatted for easier visual inspection of the data structure and content by piping it through:
Automation

Entrez Direct Commands Within Scripts

Taking an adventurous plunge into the world of programming, a shell script can be written when each output line of one step needs to be processed independently, instead of output being piped in its entirety to the next command. (The simplest shell script is merely a copy of a set of commands that are typed into the terminal for execution.)

In scripts, variables can be set to the results of a command by enclosing the statements in backtick ("\"`) characters. The variable name is prefixed by a dollar sign ("\$") to use its value as an argument in another command. Comments start with a pound sign ("\#") and are ignored. Quotation marks within quoted strings are entered by "escaping" with a backslash ("\"`). Subroutines can be used to collect common code or simplify the organization of the script.

For example, executing a script file containing:

```bash
#!/bin/bash
parse_fields() {
    echo "$1" |
    xtract -pattern Field \ 
    -pfx "[" -sfx "]" -element Name \ 
    -pfx "" -sfx "" -element FullName Description |
    sort -t $'\t' -k 2,2f | column -s $'\t' -t
}
dbs=`einfo -dbs | sort`
for db in $dbs
    do
    eix=`einfo -db $db`
    flds=`parse_fields "$eix"`
    echo "$db"
    echo ""
    echo "$flds"
    echo ""
sleep 1
done
```

will obtain the list of Entrez databases:

```bash
annotinfo
assembly
bioproject
...```
and then return the abbreviations, names, and descriptions of indexed search fields, for each individual database:

...  
mesh

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ALL]</td>
<td>All Fields</td>
<td>All terms from all searchable fields</td>
</tr>
<tr>
<td>[FILT]</td>
<td>Filter</td>
<td>Limits the records</td>
</tr>
<tr>
<td>[MESH]</td>
<td>MeSH Terms</td>
<td>MeSH Terms</td>
</tr>
<tr>
<td>[MHUI]</td>

</tr>
<tr>
<td>[TN]</td>
<td>Tree Number</td>
<td>Tree Number</td>
</tr>
<tr>
<td>[UID]</td>
<td>UID</td>
<td>Unique number assigned to publication</td>
</tr>
</tbody>
</table>

The shell script command:

```bash
sleep 1
```

adds a one second delay between steps in a loop, and can be used to help prevent overuse of the Entrez servers by advanced scripts.

**Xargs/Sh Loop**

Writing a script to loop through data can sometimes be avoided by creative use of the UNIX xargs and sh commands. Within the "sh -c" command string, the last name and initials arguments (passed in pairs by "xargs -n 2") are substituted at the "$0" and "$1" variables. All of the commands in the sh string are run separately on each name:

```bash
echo "Garber ED Casadaban MJ Mortimer RK" | xargs -n 2 sh -c 'esearch -db pubmed -query "$0 $1 [AUTH]" | xtract -pattern ENTREZ_DIRECT -lbl "$1 $0" -element Count'
```

This produces PubMed article counts for each author:

```
ED Garber       35
MJ Casadaban    46
RK Mortimer     85
```

**While Loop**

A "while" loop can also be used to independently process lines of data. Given a file "organisms.txt" containing genus-species names, the UNIX "cat" command:

```bash
cat organisms.txt
```
writes the contents of the file:

Arabidopsis thaliana
Caenorhabditis elegans
Danio rerio
Drosophila melanogaster
Escherichia coli
Homo sapiens
Mus musculus
Saccharomyces cerevisiae

This can be piped to a loop that reads one line at a time:

```
while read org
do
    esearch -db taxonomy -query "$org [LNGE] AND family [RANK]" < /dev/null |
    efetch -format docsum |
    xtract -pattern DocumentSummary -lbl "$org" |
    -element ScientificName Division
done
```

looking up the taxonomic family name and BLAST division for each organism:

<table>
<thead>
<tr>
<th>Organism</th>
<th>Family</th>
<th>Division</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arabidopsis thaliana</td>
<td>Brassicaceae</td>
<td>eudicots</td>
</tr>
<tr>
<td>Caenorhabditis elegans</td>
<td>Rhabditidae</td>
<td>nematodes</td>
</tr>
<tr>
<td>Danio rerio</td>
<td>Cyprinidae</td>
<td>bony fishes</td>
</tr>
<tr>
<td>Drosophila melanogaster</td>
<td>Drosophilidae</td>
<td>flies</td>
</tr>
<tr>
<td>Escherichia coli</td>
<td>Enterobacteriaceae</td>
<td>enterobacteria</td>
</tr>
<tr>
<td>Homo sapiens</td>
<td>Hominidae</td>
<td>primates</td>
</tr>
<tr>
<td>Mus musculus</td>
<td>Muridae</td>
<td>rodents</td>
</tr>
<tr>
<td>Saccharomyces cerevisiae</td>
<td>Saccharomycetaceae</td>
<td>ascomycetes</td>
</tr>
</tbody>
</table>

(The "< /dev/null" input redirection construct prevents esearch from "draining" the remaining lines from stdin.)

**For Loop**

The same results can be obtained with organism names embedded in a "for" loop:

```
for org in "Arabidopsis thaliana" "Caenorhabditis elegans" "Danio rerio" "Drosophila melanogaster" "Escherichia coli" "Homo sapiens" "Mus musculus" "Saccharomyces cerevisiae"
do
    esearch -db taxonomy -query "$org [LNGE] AND family [RANK]" |
    efetch -format docsum |
    xtract -pattern DocumentSummary -lbl "$org" |
    -element ScientificName Division
done
```
File Exploration

A for loop can also be used to explore the computer's file system:

```bash
for i in *
do
  if [ -f "$i" ]
    then
      echo $(basename "$i")
  fi
done
```

visiting each file within the current directory. The asterisk ("*") character indicates all files, and can be replaced by any pattern (e.g., "*.txt") to limit the file search. The if statement "-f" operator can be changed to "-d" to find directories instead of files, and "-s" selects files with size greater than zero.

Processing in Groups

Because of technical limits in the Entrez link server, it may be necessary to perform an elink operation on a large set of records by using a function that splits unique identifiers or sequence accession numbers into smaller groups:

```bash
JoinIntoGroupsOf() {
xargs -n "$@" echo |
sed 's/ /,/g'
}
alias join-into-group-of='JoinIntoGroupsOf'
```

The following example will process sequence records in groups of 200 accessions at a time:

```bash
... efetch -format acc |
join-into-groups-of 200 |
xargs -n 1 sh -c 'epost -db nuccore -format acc -id "$0" |
elink -target pubmed |
efetch -format abstract'
```

Examples

Additional examples of using EDirect to answer ad hoc questions are shown in this section.

Author Frequency

Who are the most prolific authors on rattlesnake phospholipase?

```bash
esearch -db pubmed -query 
 "crotalid venoms [MAJR] AND phospholipase [TIAB]" |
efetch -format xml |
xtract -pattern PubmedArticle 
```
This search produces:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Author</th>
</tr>
</thead>
<tbody>
<tr>
<td>74</td>
<td>Lomonte B</td>
</tr>
<tr>
<td>73</td>
<td>Gutiérrez JM</td>
</tr>
<tr>
<td>49</td>
<td>Soares AM</td>
</tr>
<tr>
<td>48</td>
<td>Marangoni S</td>
</tr>
<tr>
<td>43</td>
<td>Giglio JR</td>
</tr>
<tr>
<td>39</td>
<td>Bon C</td>
</tr>
</tbody>
</table>

**Publication Distribution**

When were the most papers about Legionnaires disease published?

```
esearch -db pubmed -query "legionnaires disease [TITL]" |
efetch -format docsum |
xtract -pattern DocumentSummary -element PubDate |
cut -c 1-4 |
sort-uniq-count-rank
```

reports the number of selected papers per year:

<table>
<thead>
<tr>
<th>Year</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1979</td>
<td>173</td>
</tr>
<tr>
<td>1980</td>
<td>102</td>
</tr>
<tr>
<td>1978</td>
<td>96</td>
</tr>
<tr>
<td>1981</td>
<td>92</td>
</tr>
<tr>
<td>1983</td>
<td>66</td>
</tr>
</tbody>
</table>

**Treatment Locations**

What is the geographic distribution of sepsis treatment studies?

```
esearch -db pubmed -query "sepsis/therapy [MESH] AND geographic locations [MESH]" |
efetch -format xml |
xtract -pattern PubmedArticle |
  -block MeshHeading -if DescriptorName@Type -equals Geographic |
  -tab "\n" -element DescriptorName |
sort-uniq-count-rank
```

returns the number of articles ranked by country (or region) of study:

<table>
<thead>
<tr>
<th>Country</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States</td>
<td>567</td>
</tr>
<tr>
<td>Spain</td>
<td>207</td>
</tr>
<tr>
<td>Great Britain</td>
<td>176</td>
</tr>
<tr>
<td>Germany</td>
<td>156</td>
</tr>
<tr>
<td>India</td>
<td>123</td>
</tr>
<tr>
<td>Europe</td>
<td>118</td>
</tr>
<tr>
<td>France</td>
<td>113</td>
</tr>
<tr>
<td>Taiwan</td>
<td>100</td>
</tr>
</tbody>
</table>
Research History

What is the historic pattern of publication on diphtheria, pertussis, and tetanus?

```bash
#!/bin/bash
result=""
for disease in diphtheria pertussis tetanus
do
  current="for (( yr = 2010; yr >= 1900; yr -= 10 ))
  do
    esearch -db pubmed -query "$disease [TITL] AND $yr:$(yr+9) [PDAT]" | 
    xtract -pattern ENTREZ_DIRECT -lbl "$(yr)s" -element Count 
  done"
  heading="echo -e "$(disease:0:4)" | tr [a-z] [A-Z]"
  current="echo -e "Years\theading\n-----\t----\n$current"
  if [ -n "$result" ]
    then
      result=join -t '\t' <(echo "$result") <(echo "$current")
    else
      result=$current
  fi
done
echo "$result"
```

gives per-decade counts of relevant papers for each disease:

<table>
<thead>
<tr>
<th>Years</th>
<th>DIPH</th>
<th>PERT</th>
<th>TETA</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010s</td>
<td>577</td>
<td>1708</td>
<td>914</td>
</tr>
<tr>
<td>2000s</td>
<td>892</td>
<td>1966</td>
<td>1344</td>
</tr>
<tr>
<td>1990s</td>
<td>1150</td>
<td>2661</td>
<td>1615</td>
</tr>
<tr>
<td>1980s</td>
<td>780</td>
<td>1746</td>
<td>1485</td>
</tr>
<tr>
<td>1970s</td>
<td>749</td>
<td>698</td>
<td>1524</td>
</tr>
<tr>
<td>1960s</td>
<td>1152</td>
<td>635</td>
<td>2086</td>
</tr>
<tr>
<td>1950s</td>
<td>1226</td>
<td>491</td>
<td>1540</td>
</tr>
<tr>
<td>1940s</td>
<td>452</td>
<td>173</td>
<td>239</td>
</tr>
<tr>
<td>1930s</td>
<td>157</td>
<td>26</td>
<td>46</td>
</tr>
<tr>
<td>1920s</td>
<td>128</td>
<td>5</td>
<td>21</td>
</tr>
<tr>
<td>1910s</td>
<td>83</td>
<td>7</td>
<td>41</td>
</tr>
<tr>
<td>1900s</td>
<td>93</td>
<td>3</td>
<td>28</td>
</tr>
</tbody>
</table>

Protein Homolog

Is there a mammalian equivalent of lycopene cyclase?

```bash
esearch -db protein -query \
    "lycopene beta cyclase [PROT] AND tomato [ORGAN]"
```
In the resulting list of GenBank division codes:

```
<table>
<thead>
<tr>
<th>Division</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCT</td>
<td>905</td>
</tr>
<tr>
<td>ENV</td>
<td>856</td>
</tr>
<tr>
<td>PLN</td>
<td>609</td>
</tr>
<tr>
<td>CON</td>
<td>197</td>
</tr>
<tr>
<td>PAT</td>
<td>127</td>
</tr>
<tr>
<td>SYN</td>
<td>2</td>
</tr>
</tbody>
</table>
```

there are no similar sequences (protein neighbors) in the HUM, PRI, ROD, MAM, VRT, or INV divisions, so lycopene cyclase is not present in animals.

### Longest Sequences

What are the longest known insulin precursor molecules?

```
esearch -db protein -query "insulin [PROT]" | efetch -format docsum | xtract -pattern DocumentSummary -element Caption Slen Title | grep -v receptor | sort -k 2,2nr | head -n 5 | cut -f 1 | xargs -n 1 sh -c 'efetch -db protein -id "$0" -format gp > "$0".gpf'
```

Post-processing excludes the longer "insulin-like receptor" sequences and saves the GenPept results to individual files named by their sequence accessions:

```
EFN61235.gpf
EFN80340.gpf
EGW08477.gpf
EKCI8433.gpf
ELK28555.gpf
```

using the right angle bracket (">") UNIX output redirection character.

### Archaea Enzyme

Which archaeabacteria have chloramphenicol acetyltransferase?

```
esearch -db protein -query "chloramphenicol acetyltransferase [PROT] AND archaea [ORGN]" | efetch -format gpc | xtract -pattern INSDSeq -element INSDSeq_organism INSDSeq_definition | grep -i chloramphenicol | cut -f 1 | sort -f | uniq
```

produces a list of organism names:

```
Methanobrevibacter ruminantium
Methanobrevibacter smithii
Methanosarcina acetivorans
...```
**Structural Similarity**

What archaea structures are similar to snake venom phospholipase?

```
esearch -db structure -query "crotalus [ORGN] AND phospholipase A2" |
elink -related |
efilter -query "archaea [ORGN]" |
efetch -format docsum |
xtract -pattern DocumentSummary \ 
  -if PdbClass -equals Hydrolase \ 
  -element PdbDescr |
sort -f | uniq -i
```

This query uses geometric comparison (structure neighboring) to find proteins that are too divergent to be detected by sequence similarity with a BLAST search:

- Crystal Structure Of Autoprocessed Form Of Tk-Subtilisin
- Crystal Structure Of Ca2 Site Mutant Of Pro-S324a
- Crystal Structure Of Ca3 Site Mutant Of Pro-S324a

**Taxonomy Search**

Which organisms contain an annotated RefSeq genome MatK gene?

```
esearch -db nuccore -query "MatK [GENE] AND NC_0:NC_999999999 [PACC]" |
efetch -format docsum |
xtract -pattern DocumentSummary -element TaxId |
sort -n | uniq |
epost -db taxonomy |
efetch -format docsum |
xtract -pattern DocumentSummary -element ScientificName |
sort
```

The first query obtains taxonomy UIDs from nucleotide document summaries and uploads them for separate retrieval from the taxonomy database:

- Acidosasa purpurea
- Acorus americanus
- Zingiber spectabile
- Zygnema circumcarinatum

**Chromosome Locations**

Where are mammalian calmodulin genes located?

```
esearch -db gene -query "calmodulin [PFN] AND mammalia [ORGN]" |
efetch -format docsum |
xtract -pattern DocumentSummary -MAP "(-)" -MAP MapLocation \ 
  -element Id Name "&MAP" ScientificName
```

...
The MAP variable is initialized with a literal dash to prevent missing data from shifting columns in the table:

<table>
<thead>
<tr>
<th></th>
<th>CALM1</th>
<th>14q32.11</th>
<th>Homo sapiens</th>
</tr>
</thead>
<tbody>
<tr>
<td>801</td>
<td>CALM3</td>
<td>19q13.32</td>
<td>Homo sapiens</td>
</tr>
<tr>
<td>808</td>
<td>CALM2</td>
<td>2p21</td>
<td>Homo sapiens</td>
</tr>
<tr>
<td>805</td>
<td>Calm1</td>
<td>6q32</td>
<td>Rattus norvegicus</td>
</tr>
<tr>
<td>24242</td>
<td>Calm3</td>
<td>1q21</td>
<td>Rattus norvegicus</td>
</tr>
<tr>
<td>12313</td>
<td>Calm2</td>
<td>12 E</td>
<td>Mus musculus</td>
</tr>
<tr>
<td>12315</td>
<td>Calm3</td>
<td>7 9.15 cM</td>
<td>Mus musculus</td>
</tr>
<tr>
<td>326597</td>
<td>CALM</td>
<td>-</td>
<td>Bos taurus</td>
</tr>
<tr>
<td>326597</td>
<td>CALM1</td>
<td>-</td>
<td>Bos taurus</td>
</tr>
<tr>
<td>326597</td>
<td>CALM3</td>
<td>6</td>
<td>Sus scrofa</td>
</tr>
</tbody>
</table>

The -else command can also be used to insert placeholders for missing data:

```bash
esearch -db gene -query "calmodulin [PFN] AND mammalia [ORGN]" |
  efetch -format docsum |
  xtract -pattern DocumentSummary \ 
    -if MapLocation -element Id Name MapLocation ScientificName \ 
    -else -element Id Name -lbl "-" -element ScientificName
```

The -def command can achieve the same result for missing elements:

```bash
esearch -db gene -query "calmodulin [PFN] AND mammalia [ORGN]" |
  efetch -format docsum |
  xtract -pattern DocumentSummary \ 
    -def "-" -element Id Name MapLocation ScientificName
```

**Exon Counts**

How many exons are in each dystrophin transcript variant?

```bash
esearch -db gene -query "DMD [GENE] AND human [ORGN]" |
  efetch -format docsum |
  xtract -pattern DocumentSummary \ 
    -block GenomicInfoType -tab \n    -element ChrAccVer,ChrStart,ChrStop | 
```

This search returns the chromosome accession and the (0-based) gene start and stop positions:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>NC_000023.11</td>
<td>33339608</td>
<td>31119221</td>
</tr>
</tbody>
</table>

These are then passed to efetch in (0-based) -chr_start and -chr_stop arguments:

```bash
xargs -n 3 sh -c 'efetch -db nuccore -format gbc \ 
  -id "$0" -chr_start "$1" -chr_stop "$2"' |
```

which converts them to (1-based) -seq_start and -seq_stop arguments and retrieves an INSDSeq XML subset record for the indicated region. That contains a number of alternatively-spliced dystrophin mRNA and CDS features.
Data extraction computes the number of intervals for each mRNA location (corresponding to individual exons or UTRs), and obtains the transcript sequence accession, transcript length, and product name from qualifiers:

```bash
xtract -insd complete mRNA "#INSDInterval" \
    transcript_id "%transcription" product |
```

Final processing sorts by number of exons:

```bash
grep -i dystrophin | 
    sed 's/dystrophin, transcript variant //g' | 
    sort -k 2,2nr -k 4,4nr
```

resulting in a table of exon counts and transcript lengths:

<table>
<thead>
<tr>
<th>Genome Range</th>
<th>Exon Count</th>
<th>Transcript Accession</th>
<th>Transcript Length</th>
<th>Product</th>
</tr>
</thead>
<tbody>
<tr>
<td>NC_000023.11</td>
<td>79</td>
<td>NM_004010.3</td>
<td>14083</td>
<td>Dp427p2</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>79</td>
<td>NM_000109.3</td>
<td>14069</td>
<td>Dp427c</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>79</td>
<td>NM_004009.3</td>
<td>14000</td>
<td>Dp427p1</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>79</td>
<td>NM_004006.2</td>
<td>13993</td>
<td>Dp427m</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>78</td>
<td>XM_006724468.1</td>
<td>13920</td>
<td>X1</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>78</td>
<td>XM_006724469.1</td>
<td>13802</td>
<td>X2</td>
</tr>
<tr>
<td>NC_000023.11</td>
<td>77</td>
<td>XM_006724470.1</td>
<td>13881</td>
<td>X3</td>
</tr>
</tbody>
</table>

This query returns a table of gene names and descriptions, for the human "Y" chromosome, in the region between the ASMT and IL3RA genes:

<table>
<thead>
<tr>
<th>Genome Range</th>
<th>Gene Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IL3RA</td>
<td>interleukin 3 receptor subunit alpha</td>
<td></td>
</tr>
<tr>
<td>LOC101928032</td>
<td>uncharacterized LOC101928032</td>
<td></td>
</tr>
<tr>
<td>LOC101928055</td>
<td>uncharacterized LOC101928055</td>
<td></td>
</tr>
<tr>
<td>SLC25A6</td>
<td>solute carrier family 25 member 6</td>
<td></td>
</tr>
<tr>
<td>LOC105373102</td>
<td>uncharacterized LOC105373102</td>
<td></td>
</tr>
<tr>
<td>LINC00106</td>
<td>long intergenic non-protein coding RNA 106</td>
<td></td>
</tr>
<tr>
<td>ASMTL-AS1</td>
<td>ASMTL antisense RNA 1</td>
<td></td>
</tr>
<tr>
<td>ASMTL</td>
<td>acetylserotonin O-methyltransferase-like</td>
<td></td>
</tr>
<tr>
<td>P2RY8</td>
<td>purinergic receptor P2Y8</td>
<td></td>
</tr>
<tr>
<td>AKAP17A</td>
<td>A-kinase anchoring protein 17A</td>
<td></td>
</tr>
<tr>
<td>ASMT</td>
<td>acetylserotonin O-methyltransferase</td>
<td></td>
</tr>
</tbody>
</table>

(The "-if ChrLoc -equals Y" test is necessary because certain genes (e.g., IL9R) are present in the pseudoautosomal regions common to both X and Y chromosomes:)
with each gene copy annotated in its own GenomicInfoType block.)

**Gene Counts**

How many genes are on each human chromosome?

```bash
for chr in {1..22} X Y MT do
  esearch -db gene -query "Homo sapiens [ORGN] AND $chr [CHR]" |
  efilter -query "alive [PROP] AND genetype protein coding [PROP]" |
  efetch -format docsum |
  xtract -pattern DocumentSummary -NAME Name \
    -block GenomicInfoType -if ChrLoc -equals "$chr" \
    -tab "\n" -element ChrLoc,"&NAME" |
  sort | uniq | cut -f 1 | sort-uniq-count-rank
done
```

returns a count of unique protein-coding genes per chromosome:

<table>
<thead>
<tr>
<th>Chromosome</th>
<th>Gene Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2067</td>
</tr>
<tr>
<td>2</td>
<td>1268</td>
</tr>
<tr>
<td>3</td>
<td>1071</td>
</tr>
<tr>
<td>4</td>
<td>755</td>
</tr>
<tr>
<td>5</td>
<td>873</td>
</tr>
<tr>
<td>6</td>
<td>1034</td>
</tr>
<tr>
<td>7</td>
<td>935</td>
</tr>
<tr>
<td>8</td>
<td>690</td>
</tr>
<tr>
<td>9</td>
<td>801</td>
</tr>
<tr>
<td>10</td>
<td>739</td>
</tr>
<tr>
<td>11</td>
<td>1288</td>
</tr>
<tr>
<td>12</td>
<td>1027</td>
</tr>
<tr>
<td>13</td>
<td>335</td>
</tr>
<tr>
<td>14</td>
<td>607</td>
</tr>
<tr>
<td>15</td>
<td>608</td>
</tr>
</tbody>
</table>
The range construct cannot be used for Roman numerals, so the equivalent query on Saccharomyces cerevisiae would need to explicitly list all chromosomes:

```
for chr in I II III IV V VI VII VIII IX X XI XII XIII XIV XV XVI MT
```

Plastid genes can be selected with "source plastid [PROP]".

**Complete Genomes**

What complete genomes are available for Escherichia coli?

```
esearch -db assembly -query "Escherichia coli [ORGN] AND representative [PROP]" |
elink -target nuccore -name assembly_nuccore_refseq |
efetch -format docsum |
xtract -pattern DocumentSummary -element AccessionVersion Slen Title |
|sed 's/,.*//'
|sort -t $'	' -k 2,2nr
```

This search finds genomic assemblies and sorts the results by sequence length, allowing complete genomes to be easily distinguished from smaller plasmids:

<table>
<thead>
<tr>
<th>Accession</th>
<th>Slen</th>
<th>Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>NC_002695.1</td>
<td>5498450</td>
<td>Escherichia coli O157:H7 str. Sakai chromosome</td>
</tr>
<tr>
<td>NC_018658.1</td>
<td>5273097</td>
<td>Escherichia coli 0104-H4 str. 2011C-3493 ...</td>
</tr>
<tr>
<td>NC_011751.1</td>
<td>5202090</td>
<td>Escherichia coli UMN026 chromosome</td>
</tr>
<tr>
<td>NC_011750.1</td>
<td>5132068</td>
<td>Escherichia coli IAI39 chromosome</td>
</tr>
<tr>
<td>NC_017634.1</td>
<td>4747819</td>
<td>Escherichia coli O83:H1 str. NRG 857C chromosome</td>
</tr>
<tr>
<td>NC_000913.3</td>
<td>4641652</td>
<td>Escherichia coli str. K-12 substr. MG1655</td>
</tr>
<tr>
<td>NC_017659.1</td>
<td>147060</td>
<td>Escherichia coli O83:H1 str. NRG 857C plasmid ...</td>
</tr>
</tbody>
</table>

The sed command removes extraneous text in the title (e.g., complete genome, complete sequence, primary assembly) after a comma.

A similar query for humans, additionally filtering out scaffolds, contigs, and plasmids:

```
esearch -db assembly -query "Homo sapiens [ORGN] AND representative [PROP]" |
elink -target nuccore -name assembly_nuccore_refseq |
efetch -format docsum |
xtract -pattern DocumentSummary -element AccessionVersion Slen Title |
|sed 's/,.*//' | grep -v scaffold | grep -v contig | grep -v plasmid | sort
```

returns the assembled chromosome and mitochondrial sequence records:
This process can be automated to loop through a list of specified organisms:

```bash
for org in "Agrobacterium tumefaciens" "Bacillus anthracis" "Escherichia coli" "Neisseria gonorrhoeae" "Pseudomonas aeruginosa" "Shigella flexneri" "Streptococcus pneumoniae"
    do
esearch -db assembly -query "$org [ORGN]" |
efilter -query "representative [PROP]" |
elink -target nuccore -name assembly_nuccore_refseq |
efetch -format docsum |
xtract -pattern DocumentSummary -element AccessionVersion Slen Title |
sed 's/,.*//' |
grep -v -i -e scaffold -e contig -e plasmid -e sequence -e patch |
sort -t $'	' -k 2,2nr
done
```

which generates:

```
NC_011985.1  4005130  Agrobacterium radiobacter K84 chromosome 1
NC_011983.1  2650913  Agrobacterium radiobacter K84 chromosome 2
NC_005945.1  5228663  Bacillus anthracis str. Sterne chromosome
NC_003997.3  5227415  Bacillus anthracis str. Ames chromosome
```
Amino Acid Composition

What is the amino acid composition of human titin?

```
abbrev=( Ala Asx Cys Asp Glu Phe Gly His Ile \ 
       Xle Lys Leu Met Asn Pyl Pro Gln Arg \ 
       Ser Thr Sec Val Trp Xxx Tyr Glx )
```

```
efetch -db protein -id "Q8WZ42.4" -format gpc |
xtract -pattern INSDSeq -element INSDSeq_sequence |
tr A-Z a-z |
sed 's/[^a-z]//g' |
fold -w 1 |
sort-uniq-count |
while read num lttr |
do |
   idx=$(printf %i "$lttr")
   ofs=$((idx-97))
   echo -e "${abbrev[$ofs]} \t$num"
   done |
sort
```

produces a table of residue counts using the three-letter amino acid abbreviations:

<table>
<thead>
<tr>
<th>Amino Acid</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ala</td>
<td>2084</td>
</tr>
<tr>
<td>Arg</td>
<td>1640</td>
</tr>
<tr>
<td>Asn</td>
<td>1111</td>
</tr>
<tr>
<td>Asp</td>
<td>1720</td>
</tr>
<tr>
<td>Cys</td>
<td>513</td>
</tr>
<tr>
<td>Gln</td>
<td>942</td>
</tr>
<tr>
<td>Glu</td>
<td>3193</td>
</tr>
<tr>
<td>Gly</td>
<td>2066</td>
</tr>
<tr>
<td>His</td>
<td>478</td>
</tr>
<tr>
<td>Ile</td>
<td>2062</td>
</tr>
<tr>
<td>Leu</td>
<td>2117</td>
</tr>
<tr>
<td>Lys</td>
<td>2943</td>
</tr>
<tr>
<td>Met</td>
<td>398</td>
</tr>
<tr>
<td>Phe</td>
<td>908</td>
</tr>
<tr>
<td>Pro</td>
<td>2517</td>
</tr>
<tr>
<td>Ser</td>
<td>2463</td>
</tr>
<tr>
<td>Thr</td>
<td>2546</td>
</tr>
<tr>
<td>Trp</td>
<td>466</td>
</tr>
</tbody>
</table>
Amino Acid Substitutions

What are the missense products of green-sensitive opsin?

```bash
ApplySNPs() {
    seq=""
    last=""
    while read rsid accn pos res
    do
        if [ "$accn" != "$last" ]
            then
            insd=$(efetch -db protein -id "$accn" -format gbc < /dev/null)
            seq=$(echo $insd | xtract -pattern INSDSeq -element INSDSeq_sequence)
            last=$accn
            fi
            pos=$(($pos+1))
        pfx=""
        sfx=""
        echo ">rs$rsid [$accn $res@$pos]"
        if [ $pos -gt 1 ]
            then
            pfx=$(echo ${seq:0:$pos-1})
            fi
        if [ $pos -lt ${#seq} ]
            then
            sfx=$(echo ${seq:$pos})
            fi
        echo "$pfx$res$sfx" | fold -w 50
    done
}
esearch -db gene -query "CBD [GENE] AND human [ORGN]" |
elink -target snp |
efetch -format xml |
xtract -pattern Rs -RSID Rs@rsId |
    -block FxnSet -if @fxnClass -equals missense |
    -sep "." -element "&RSID" @protAcc,@protVer @aaPosition |
    -tab "\n" -element @residue |
sort -t $'\t' -k 2,2 -k 3,3n -k 4,4 | uniq | ApplySNPs
```

The query returns an intermediate table of non-synonymous amino acid substitutions (with 0-based location coordinates) derived from single nucleotide polymorphisms:

<table>
<thead>
<tr>
<th>Accession</th>
<th>Accession</th>
<th>Position</th>
<th>Residue</th>
</tr>
</thead>
<tbody>
<tr>
<td>104894915</td>
<td>NP_000504.1</td>
<td>93</td>
<td>K</td>
</tr>
<tr>
<td>782122931</td>
<td>NP_000504.1</td>
<td>95</td>
<td>V</td>
</tr>
<tr>
<td>781899063</td>
<td>NP_000504.1</td>
<td>97</td>
<td>T</td>
</tr>
<tr>
<td>781807082</td>
<td>NP_000504.1</td>
<td>102</td>
<td>A</td>
</tr>
</tbody>
</table>

...
The rows are then processed to produce protein sequences with the individual residue substitutions in upper case:

```bash
cat &ACC &SEQ &PRD
```

3'UTR Sequences

What are the 3' UTR sequences for lycopene cyclase?

```bash
ThreePrimeUTRs() {
    xtract -pattern INSDDSeq -ACC INSDDSeq_accession-version -SEQ INSDDSeq_sequence -group INSDDFeature -if INSDDFeature_key -equals CDS -PRD "(-)" -block INSDDQualifier -if INSDDQualifier_name -equals product -PRD INSDDQualifier_value -block INSDDFeature -pfc "\n" -element "&ACC" -rst -last INSDDInterval_to -element "&SEQ" &PRD | while read acc pos seq prd
    do
        if [ $pos -lt ${#seq} ];
            then
                echo -e "$acc 3'UTR: $((pos+1))..${#seq} $prd"
                echo "${seq:$pos}" | fold -w 50
            elif [ $pos -ge ${#seq} ];
                then
                    echo -e "$acc NO 3'UTR"
            fi
        done

    esearch -db nuccore -query "5.5.1.19 [ECNO]" | efilter -molecule mrna -source refseq | efetch -format gbc | ThreePrimeUTRs
```

prints the sequences immediately following the CDS stop codon:

```bash
>NM_001328461.1 3'UTR: 1737..1871 lycopene beta cyclase, chloroplastic
gatgaatatagagttactgtgttgtaagctaatcatcatactgatgcaag
tgcattatcacatttacttctgctgatgattgttcataagattatgagtt
agccatttatcaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
>NM_001316759.1 3'UTR: 1628..1690 lycopene beta cyclase, chloroplastic
atccgagtaattcggaatcttgtccaattttatagccttatattaatac
```

Upstream Sequences

What sequences are upstream of phenylalanine hydroxylase genes?

```bash
esearch -db nuccore -query "U49897 [ACCN]" | elink -target gene |
```
elink -target homologene |
elink -target gene |
efetch -format docsum |
xtract -pattern DocumentSummary -if GenomicInfoType -element Id |
   -block GenomicInfoType -element ChrAccVer ChrStart ChrStop |
awk -F 't' -v 'OFS=t' 'print $1, $2, $3+1, $4+1'

obtains a series of homologous genes, converting the gene coordinates to 1-based positions suitable for retrieving sequence regions:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>5053</td>
<td>NC_000012.12</td>
<td>102917603</td>
<td>102838326</td>
</tr>
<tr>
<td>18478</td>
<td>NC_000076.6</td>
<td>87521795</td>
<td>87584137</td>
</tr>
<tr>
<td>38871</td>
<td>NT_037436.4</td>
<td>7760453</td>
<td>7763166</td>
</tr>
<tr>
<td>24616</td>
<td>NC_005106.4</td>
<td>28066639</td>
<td>28129772</td>
</tr>
<tr>
<td>378962</td>
<td>NC_007115.6</td>
<td>17420391</td>
<td>17402704</td>
</tr>
</tbody>
</table>

Given a shell script named "upstream.sh":

```bash
#!/bin/bash -norc

bases=1500
if [ $1 ]
    then
        bases=$1
fi

while read id accn start stop
    do
        if [[ $start -eq 0 || $stop -eq 0 || $start -eq $stop ]]
            then
                echo "Skipping $id due to ambiguous coordinates"
                continue
        fi
        if [ $start -gt $stop ]
            then
                stop=$(( start + bases ))
                start=$(( start + 1 ))
                strand=2
        else
                stop=$(( start - 1 ))
                start=$(( start - bases ))
                strand=1
        fi
        rslt=`efetch -db nuccore -id $accn -format fasta \
            -seq_start $start -seq_stop $stop -strand $strand < /dev/null`
        echo "$rslt"
    done
```

the data lines can be piped through:

`upstream.sh 500`
to extract and print the 500 nucleotides immediately upstream of each gene. (Without the argument it will default to 1500 nucleotides.)

**Author Combinations**

What are the authorship patterns among selected individuals?

The "coauthors.sh" script takes author name arguments to construct a custom data extraction command for analyzing research collaboration patterns:

```bash
#!/bin/bash -norc

if [ "$#" -lt 2 ]
then
    echo "Must supply at least two author names"
    exit 1
fi

query="xtract -pattern PubmedArticle -element MedlineCitation/PMID"

# append a -block statement for each author argument
for auth in "$@
do
    query=`echo "$query -block Author -if LastName -equals "$auth" \
            -sep " " -element LastName,Initials"`
done

query=`echo "$query | sort -t $'	' -k 2f -k 1,1n"`

if [ -t 0 ]
then
    # stand-alone command, print constructed query for later use
    echo "$query"
else
    # dynamically execute query on XML data piped to script
    res=`eval "$query"
    echo "$res"
fi
```

If XML publication data are piped to the script, it will read the data and immediately execute the generated xtract query. Otherwise, if called as a stand-alone command, it will print the custom query instructions for later use.

Running the following command:

```bash
esearch -db pubmed -query "Casadaban MJ [AUTH] OR Berg CM [AUTH]" |
efetch -format xml |
./coauthors.sh Casadaban Groisman Berg Garber |
./extract-fuse.pl pubmed > author_patterns.htm
```

first produces an internal result table of PMIDs grouped by author combination:
The sorted lines are then piped to the "extract-fuse.pl" script:

```perl
#!/usr/bin/perl

my $max = scalar @ARGV;
if ( $max < 1 ) {
    die "Need argument for database\n";
}
my $db = $ARGV[0];

my $thisline = "";
my $laststr = "";
my $str = "";
my $uid = "";
my $uidlist = "";
my $count = 0;

my $pfx = "";
while ($thisline = <STDIN>) {
    $thisline =~ s/\r//;
    $thisline =~ s/\n//;
    if ($thisline =~ /^([\^t\t]+)\t(.+)$/) {
        $uid = $1;
        $str = $2;
        if ( lc ($str) ne lc ($laststr) and $laststr ne "" ) {
            $laststr =~ s/\t/, /g;
            print "<p>(<a href="$base/$db/$uidlist">") - $laststr</a>) - $laststr</p><\n";
            $pfx = "";
            $count = 0;
            $uidlist = "";
        }
        $laststr = $str;

        $uidlist .= "$pfx$uid";
        $pfx = ",";
        $count++;
    }
}
```

Entrez Direct: E-utils on the UNIX Command Line
if ( $laststr ne "" ) {
    $laststr =~ s/\t/, /g;
    print "<p>(<a href="$base/db/$uidlist">";
    print " $count </a>) - $laststr</p>
";
}

which combines them into PubMed query URLs, one for each author pattern:

https://www.ncbi.nlm.nih.gov/pubmed/1827084,2954879,3020001, ...

Those are then wrapped, along with a record count, in the appropriate HTML tags for web display. If the resulting file is opened with a browser, it presents an argument-order-dependent view of author collaboration:

( 55 ) - Berg CM
( 10 ) - Berg CM, Berg DE
(  1 ) - BERG CM, GARBER ED
(  6 ) - Berg DE, Berg CM
(  39 ) - Casadaban MJ
(  6 ) - Casadaban MJ, Groisman EA
(  1 ) - Casadaban MJ, Groisman EA, Berg CM

Clicking on a hyperlinked record count number opens the document summary or individual article page, so the actual publications can be examined.

Indexed Fields

What date fields are indexed for PubMed?

```
einfo -db pubmed |
xtract -pattern Field \  
  -if IsDate -equals Y -and IsHidden -equals N \  
    -pfx "[" -sfx "]" -element Name \  
    -pfx "" -sfx "" -element FullName |  
sort -k 2f | expand
```

This produces a list of field abbreviations and names filtered by index type:

```
[CDAT]  Date - Completion
[CRDT]  Date - Create
[EDAT]  Date - Entrez
[MHDA]  Date - MeSH
[MDAT]  Date - Modification
[PDAT]  Date - Publication
```
Digital Object Identifiers

How are digital object identifiers obtained from PubMed articles?

```bash
esearch -db pubmed -query "Rowley JD [AUTH]" |
efetch -format xml |
xtract -head '<html><body>' -tail '</body></html>' \
    -pattern PubmedArticle -PMID MedlineCitation/PMID \
    -block ArticleId -if @IdType -equals doi \
    -tab '\n' -pfx '<a href="http://dx.doi.org/" \
    -sep '=>' -sfx '</a>' -if @IdType -equals doi \
    -encode ArticleId,"&PMID"
```

extracts the DOIs and constructs the appropriate URL references:

```html
<html><body>
<p><a href="http://dx.doi.org/10.1038/leu.2013.340">24496283</a></p>
<p><a href="http://dx.doi.org/10.1073/pnas.1310656110">23818607</a></p>
<p><a href="http://dx.doi.org/10.1073/pnas.1310144110">23798388</a></p>
...
</body>
</html>
```

These intermediate lines are then piped through:

```bash
xtract -format
```

to produce a minimal HTML document with clickable links:

```xml
<?xml version="1.0"?>
<!DOCTYPE html>
<html>
<body>
<p><a href="http://dx.doi.org/10.1038/leu.2013.340">24496283</a></p>

Phrase Searching

Can phrase searching be simulated in Entrez?

The "entrez_phrase_search" script included with EDirect takes advantage of the fact that some short phrases are indexed in certain Entrez fields. Given an input phrase, the script generates overlapping pairs of adjacent words, separately queries on each pair to determine which are present in the pubmed title or abstract index, and keeps those that appear in at least 10 articles. Independent phrases are separated by a plus ("+") sign.

For example, running the following command:

```bash
entrez_phrase_search -db pubmed -field WORD \n    selective serotonin reuptake inhibitor + monoamine oxidase inhibitor
```
will generate word pairs from each phrase and run a query on each pair. The individual
term counts are:

<table>
<thead>
<tr>
<th>Term</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>selective serotonin</td>
<td>11343</td>
</tr>
<tr>
<td>serotonin reuptake</td>
<td>11892</td>
</tr>
<tr>
<td>reuptake inhibitor</td>
<td>6714</td>
</tr>
<tr>
<td>monoamine oxidase</td>
<td>21722</td>
</tr>
<tr>
<td>oxidase inhibitor</td>
<td>3680</td>
</tr>
</tbody>
</table>

The combined query will return a search result with 36 articles, and these can then be
retrieved by piping to efetch. The script in its current form will not match phrases with
plurals (e.g., serotonin reuptake inhibitors) or hyphens (e.g., monoamine-oxidase
inhibitor).

**Gene-Protein Links**

What proteins are produced by a given gene?

Given a query in the gene database, the following commands:

```bash
esearch -db gene -query "beta galactosidase [PFN]" |
elink -target protein -name gene_protein_refseq -cmd neighbor |
xtract -pattern LinkSet -element Id
```

will show the gene ID in the first column and linked RefSeq protein UIDs in subsequent
columns.

Piping the results to a Perl script named "gene-protein-links.pl" will read the identifiers
and run separate efetch queries on the gene and protein databases:

```perl
#!/usr/bin/perl

while ($line = <STDIN>) {
   chomp ($line);
   @uids = split( \t/, $line);
   $gene = $uids [0];
   $proteins = join (',', @uids [1..$#uids]);

   $symbol = $data = '';

   $cmd = "efetch -format docsum -db gene -id $gene | ";
   $cmd .= "xtract -pattern DocumentSummary -element Name CommonName";
   open (CMD, "$cmd|");
   while (<CMD>) {
      $symbol .= $_;
   }
   close CMD;

   if ($proteins ne ")") {
      $cmd = "efetch -format docsum -db protein -id $proteins | ";
      $cmd .= "xtract -pattern DocumentSummary -element Caption Slen Title";
      open (CMD, "$cmd|");
```
while (<CMD>) {
    $data .= $_;
}
close CMD;

print "$symbol$data\n";

printing the gene symbol and organism common name, followed by the protein accessions, lengths, and titles:

<table>
<thead>
<tr>
<th>Gene Symbol</th>
<th>Organism</th>
<th>Accession</th>
<th>Length</th>
<th>Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLB1</td>
<td>human</td>
<td>NP_001129074</td>
<td>546</td>
<td>beta-galactosidase isoform c preproprotein ...</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NP_001073279</td>
<td>647</td>
<td>beta-galactosidase isoform b [Homo sapiens]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NP_000395</td>
<td>677</td>
<td>beta-galactosidase isoform a preproprotein ...</td>
</tr>
<tr>
<td>Glb1</td>
<td>house mouse</td>
<td>NP_033882</td>
<td>647</td>
<td>beta-galactosidase preproprotein [Mus musculus]</td>
</tr>
<tr>
<td>Glb1</td>
<td>Norway rat</td>
<td>NP_001101662</td>
<td>647</td>
<td>beta-galactosidase precursor [Rattus norvegicus]</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>...</td>
</tr>
</tbody>
</table>

**Bulk Downloads**

How can the entire set of GenBank records for mammals be obtained?

```bash
grep ".seq.gz" |
grep -e gbmam -e gbpri -e gbrod |
while read file
do
gzcat "$file"
rm "$file"
done
```

will use the ftp-ls and ftp-cp scripts (included with the EDirect software) to retrieve and print GenBank flatfiles for human, primate, rodent, and other mammals:

**GBMAM1.SEQ**

Genetic Sequence Data Bank  
February 15 2015

NCBI-GenBank Flat File Release 206.0

Other Mammalian Sequences (Part 1)

20709 loci, 155323216 bases, from 20709 reported sequences

<table>
<thead>

For systems with Aspera Connect installed, the asp-ls and asp-cp scripts can be used for  
faster retrieval:  

asp-ls genbank |  
grep ".seq.gz" |  
grep -e gbmam -e gbpri -e gbrod |  
while read file  
do  
asp-cp genbank "$file"  
gzcat "$file"
rm "$file"
done

Appendices

Setting Contact Address and Script Name

EDirect automatically obtains the user's e-mail address from the system, to have someone to notify in case a runaway script causes problems with an Entrez server, but if another contact address is desired (e.g., that of a system administrator or software developer) it can be explicitly set at the beginning of a pipeline or script:

```bash
econtact -email author_email_address -tool name_of_script
```

That way the NCBI has information on who to contact if an infinite loop in a script accidentally abuses NCBI resources. (For convenience, the preferred e-mail address and software tool name can also be set in all E-utilities-calling operations.)

Command-Line Arguments

Arguments for the EDirect functions are listed below:

Use esearch to start a new Entrez search on indexed terms:

**Query Specification**

- `-db` Database name
- `-query` Query string

**Document Order**

- `-sort` Result presentation order

**Date Constraint**

- `-days` Number of days in the past
- `-datetype` Date field abbreviation
- `-mindate` Start of date range
- `-maxdate` End of date range

**Limit by Field**

- `-field` Query words individually in field
- `-pairs` Query overlapping word pairs

**Spell Check**

- `-spell` Correct misspellings in query

** Miscellaneous Arguments**

- `-label` Alias for query step
The elink function looks up related articles or associated records:

**Destination Database**
- **-related** Neighbors in same database
- **-target** Links in different database
- **-name** Link name (e.g., pubmed_protein_refseq)

**Direct Record Selection**
- **-db** Database name
- **-id** Unique identifier(s)

**Advanced Control**
- **-cmd** Command type (returns eLinkResult XML)
- **-mode** "ref" uses LinkOut provider’s web site
- **-holding** Name of LinkOut provider

**Batch Processing**
- **-batch** Bypass Entrez history mechanism

**Miscellaneous Arguments**
- **-label** Alias for query step

**Use efilter to restrict search or link results by indexed terms:**

**Query Specification**
- **-query** Query string

**Document Order**
- **-sort** Result presentation order

**Date Constraint**
- **-days** Number of days in the past
- **-datatype** Date field abbreviation
- **-mindate** Start of date range
- **-maxdate** End of date range

**Limit by Field**
- **-field** Query words individually in field
- **-pairs** Query overlapping word pairs

**Spell Check**
- **-spell** Correct misspellings in query
Publication Filters

-pub abstract, clinical, english, free, historical, journal, last_week, last_month, last_year, preprint, review, structured

Sequence Filters

-feature gene, mrna, cds, mat_peptide, ...
-location mitochondrion, chloroplast, plasmid, plastid
-molecule genomic, mrna, trna, rrna, ncrna
-organism animals, archaea, bacteria, eukaryotes, fungi, human, insects, mammals, plants, protists, rodents, viruses
-source genbank, insd, pdb, pir, refseq, swissprot, tpa

Gene Filters

-status alive
-type coding, pseudo

Miscellaneous Arguments

-label Alias for query step

The record retrieval function is efetch:

Format Selection

-format Format of record or report
-mode text, xml, asn.1, json

Direct Record Selection

-db Database name
-id Unique identifier or accession number

Sequence Range

-seq_start First sequence position to retrieve
-seq_stop Last sequence position to retrieve
-strand Strand of DNA to retrieve

Gene Range

-chr_start Sequence range from 0-based coordinates
-chr_stop in gene docsum GenomicInfoType object

Miscellaneous

-complexity 0 = default, 1 = bioseq, 3 = nuc-prot set
-extend Extend sequence retrieval in both directions
-extrafeat Bit flag specifying extra features
The xtract function is used for processing XML data:

**Processing Flags**

- **-compress** Compress runs of spaces
- **-mixed** Allow PubMed mixed content
- **-strict** Remove HTML highlight tags
- **-accent** Delete Unicode accents

**Data Source**

- **-input** Read XML from file instead of stdin

**Exploration Argument Hierarchy**

- **-pattern** Name of record within set
- **-group** Use of different argument
- **-block** names allows command-line control of nested looping

**Exploration Constructs**

- **Object** DateCreated
- **Parent/Child** Book/AuthorList
- **Heterogeneous** "PubmedArticleSet/"
- **Nested** "*/Taxon"
- **Recursive** "**/Gene-commentary"

**Conditional Execution**

- **-if** Element [@attribute] required
- **-unless** Skip if element matches
- **-and** All tests must pass
- **-or** Any passing test suffices
- **-else** Execute if conditional test failed
- **-position** Must be at [first|last] location in list

**String Constraints**

- **-equals** String must match exactly
- **-contains** Substring must be present
- **-starts-with** Substring must be at beginning
- **-ends-with** Substring must be at end
- **-is-not** String must not match

**Numeric Constraints**

- **-gt** Greater than
- **-ge** Greater than or equal to
- **-lt** Less than
- **-le** Less than or equal to
-eq                 Equal to
-ne                 Not equal to

Format Customization

-ret                Override line break between patterns
-tab                Replace tab character between fields
-sep                Separator between group members
-pfx                Prefix to print before group
-sfx                Suffix to print after group
-clr                Clear queued tab separator
-pfc                Preface combines -clr and -pfx
-rst                Reset -sep, -pfx, and -sfx
-def                Default placeholder for missing fields
-lbl                Insert arbitrary text

Element Selection

-element            Print all items that match tag name
-first              Only print value of first item
-last               Only print value of last item
-NAMES               Record value in named variable

-element Constructs

Tag                 Caption
Group               Initials, LastName
Parent/Child        MedlineCitation/PMID
Attribute            DescriptorName@MajorTopicYN
Recursive            "**/Gene-commentary_accession"
Object Count         "#Author"
Item Length          "%Title"
Element Depth        "^PMID"
Variable             "&NAME"

Special -element Operations

Parent Index         "+"
XML Subtree          "+"
Children             "$"
Attributes           "+" 

Numeric Processing

-num                Count
-len                Length
-sum                Sum
-min                Minimum
-max                Maximum
-inc                Increment
-dec                Decrement
-sub                Difference
-avg                Average
-dev

String Processing

-encode URL-encode <, >, &, ", and ' characters
-upper Convert text to upper-case
-lower Convert text to lower-case
-title Capitalize initial letters of words

Phrase Processing

-terms Partition phrase at spaces
-words Split at punctuation marks
-pairs Adjacent informative words
-letters Separate individual letters
-indices Experimental index generation

Sequence Coordinates

-0-based Zero-Based
-1-based One-Based
-ucsc-based Half-Open

Command Generator

-insd Generate INSDSeq extraction commands

-insd Argument Order

Descriptors INSDSeq_sequence INSDSeq_definition INSDSeq_division
Flags [complete|partial]
Feature(s) CDS,mRNA
Qualifiers INSDFeature_key "#INSDInterval" gene product

Miscellaneous

-head Print before everything else
-tail Print after everything else
-hd Print before each record
-tl Print after each record

Reformatting

-format [copy|compact|flush|indent|expand]

Modification

-filter Object

[retain|remove|encode|decode|shrink|expand|accent]
[content|cdata|comment|object|attributes|container]
-verify       Report XML data integrity problems

Summary

-outline     Display outline of XML structure
-synopsis    Display count of unique XML paths

Documentation

-examples    Examples of EDirect and xtract usage
-extras      Batch and local processing examples

The einfo function returns information on Entrez indexed fields:

Database Selection

-db          Database name
-dbs         Get all database names

Data Summaries

-fields      Print field names
-links       Print link names

Several additional functions are provided by EDirect:

epost

-db          Database name
-id           Unique identifier(s) or accession number(s)
-format       uid or acc
-input        Read from file instead of stdin
-label        Alias for query step

eproxy

-alias       File of aliases
-pipe        Read aliases from stdin

econtact

-email       Contact person's address
-tool         Name of script or program

nquire

-get          Uses HTTP GET instead of POST
-url          Base URL for external search

In addition, -email and -tool are available in all E-utilities-calling functions to override default values, -http get will force the use of GET instead of POST, -alias will specify a file of shortcut keywords and query strings or URL sections, and -help will print the list of arguments for each function.
For debugging, -silent will suppress link failure retry messages, -verbose will display the <ENTREZ_DIRECT> field values at each step, -debug will print the internal URL query and XML results of each step, and -base will specify a particular server for quality assurance testing.

**EFetch Formats**

EFetch -format and -mode values for each database are shown below:

<table>
<thead>

**ELink Commands**

ELink -cmd options produce results as LinkSet XML:

<table>
<thead>
<tr>
<th>-cmd</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>neighbor</td>
<td>Neighbors or links</td>
</tr>
<tr>
<td>neighbor_score</td>
<td>Neighbors with computed similarity scores</td>
</tr>
<tr>
<td>acheck</td>
<td>All links available</td>
</tr>
<tr>
<td>ncheck</td>
<td>Existence of neighbors</td>
</tr>
<tr>
<td>lcheck</td>
<td>Existence of external links (LinkOuts)</td>
</tr>
<tr>
<td>llinks</td>
<td>Non-library LinkOut providers</td>
</tr>
<tr>
<td>llinkslib</td>
<td>All LinkOut providers</td>
</tr>
<tr>
<td>prlinks</td>
<td>Primary LinkOut provider, or URL for single UID with -mode ref</td>
</tr>
</tbody>
</table>

**EInfo Data**

EInfo field data contains status flags for several term list index properties:

```
<Field>
  <Name>ALL</Name>
  <FullName>All Fields</FullName>
  <Description>All terms from all searchable fields</Description>
  <TermCount>138982028</TermCount>
  <IsDate>N</IsDate>
  <IsNumerical>N</IsNumerical>
  <SingleToken>N</SingleToken>
  <Hierarchy>N</Hierarchy>
  <IsHidden>N</IsHidden>
  <IsTruncatable>Y</IsTruncatable>
  <IsRangable>N</IsRangable>
</Field>
```

**UNIX Utilities**

Several useful classes of UNIX text processing filters, with selected arguments, are presented below:

Process by Contents:
sort    Sorts lines of text
-f    Ignore case
-n    Numeric comparison
-r    Reverse result order
-k    Field key (start, stop or first)
-u    Unique lines with identical keys
-b    Ignore leading blanks
-s    Stable sort
-t    Specify field separator
uniq    Removes repeated lines
-c    Count occurrences
-i    Ignore case
-f    Ignore first n fields
-s    Ignore first n characters
-d    Only output repeated lines
-u    Only output non-repeated lines
grep    Matches patterns using regular expressions
-i    Ignore case
-v    Invert search
-w    Search expression as a word
-x    Search expression as whole line
-e    Specify individual pattern
-c    Only count number of matches
-n    Print line numbers

Regular Expressions:

Characters

.    Any single character (except newline)
\w    Alphabetic [A-Za-z], numeric [0-9], or underscore (_)
\s    Whitespace (space or tab)
\    Escapes special characters
[]    Matches any enclosed characters

Positions

^    Beginning of line
$    End of line
\b    Word boundary

Repeat Matches
? 0 or 1
* 0 or more
+ 1 or more
{n} Exactly n

Modify Contents:

sed Replaces text strings
-e Specify individual expression

tr Translates characters
-d Delete character

rev Reverses characters on line

Format Contents:

column Aligns columns by content width
-s Specify field separator
-t Create table

expand Aligns columns to specified positions
-t Tab positions

fold Wraps lines at a specific width
-w Line width

Filter by Position:

cut Removes parts of lines
-c Characters to keep
-f Fields to keep
-d Specify field separator
-s Suppress lines with no delimiters

head Prints first lines
-n Number of lines

tail Prints last lines
-n Number of lines

Miscellaneous:
wc  Counts words, lines, or characters
    -c  Characters
    -l  Lines
    -w  Words

xargs  Constructs arguments
    -n  Number of words per batch

File Compression:

tar  Archive files
    -c  Create archive
    -f  Name of output file
    -z  Compress archive with gzip

gzip  Compress file
    -k  Keep original file
    -9  Best compression

unzip  Decompress .zip archive
    -p  Pipe to stdout

gzcat  Decompress .gz archive and pipe to stdout

Directory and File Navigation:

cd  Changes directory

/  Root
~  Home
.  Current
..  Parent
-  Previous

ls  Lists file names
    -l  One entry per line
    -a  Show files beginning with dot (.)
    -1  List in long format
    -R  Recursively explore subdirectories
    -S  Sort files by size
    -t  Sort by most recently modified

pwd  Prints working directory path

Additional documentation with detailed explanations and examples can be obtained by typing "man" followed by a command name.
**Terminal Keyboard Shortcuts**

Control and escape sequences can be used within a terminal session to navigate through the command history and to move the cursor for editing the command currently being entered:

**Command history:**

- **Ctrl-n**  Next command
- **Ctrl-p**  Previous command

**Move cursor forward:**

- **Ctrl-e**  To end of line
- **Ctrl-f**  By one character
- **Esc-f**  By one argument

**Move cursor backward:**

- **Ctrl-a**  To beginning of line
- **Ctrl-b**  By one character
- **Esc-b**  By one argument

**Delete:**

- **Del**  Previous character
- **Ctrl-d**  Next character
- **Ctrl-k**  To end of line
- **Ctrl-u**  Entire line
- **Ctrl-w**  Previous word
- **Esc-Del**  Previous argument
- **Esc-d**  Next argument

**Autocomplete:**

- **Tab**  Completes directory or file names

**Program control:**

- **Ctrl-c**  Quit running program
- **^x^y**  Run last command replacing x with y

(Note that Control sequences are typed by holding down Control, hitting the other key, and releasing Control, while Escape sequences are typed by hitting Escape and then hitting the other key.)

**Release Notes**

**EDirect Version 7.10: August 10, 2017**

- Xtract -ascii converts non-ASCII Unicode to hexadecimal numeric character references.
- Setup script recognizes Cygwin running under the MinGW emulator.
EDirect Version 7.00: July 10, 2017

- Xtract -mixed and -strict handle multiply-escaped HTML tags.
- Efetch removes normal and escaped HTML tags from PubMed fields.
- Esearch -field processes individual query terms using the designated field, also removing stop words.
- Esearch -pairs splits the query phrase into adjacent overlapping word pairs.

EDirect Version 6.90: July 5, 2017

- Xtract -mixed replaces -relaxed, and -accent replaces -plain.
- Efetch uses larger chunks for -format uid, url, and acc.
- Esearch -log shows constructed URL and QueryTranslation result.

EDirect Version 6.80: June 8, 2017

- Modified download instructions to use edirect.tar.gz archive.
- The ftp-cp script can now read from stdin without the need for xargs.
- Rerunning ftp-cp or asp-cp only attempts to download missing files.

EDirect Version 6.70: May 8, 2017

- Added asp-cp script for faster download of NCBI ftp files using Aspera Connect.
- Xtract -strict and -relaxed handle empty HTML tag variants (e.g., <b/> and <sup/>).

EDirect Version 6.60: April 25, 2017

- Xtract -strict replaces -degloss to remove HTML <i>, <b>, <u>, <sup> and <sub> tags from XML contents.
- Xtract -relaxed allows HTML tags in XML contents, to support current PubMed ftp release files.
- Xtract -plain removes Unicode accents.
- The setup.sh script prints an error message if it cannot fetch missing Perl modules.

EDirect Version 6.50: March 6, 2017

- Xtract -degloss replaces -html to remove HTML <i>, <b>, <u>, <sup> and <sub> tags.

EDirect Version 6.40: March 1, 2017

- Epost detects accession.version input for sequence databases and sets -format acc.
- Xtract -html [remove|encode] converts <i> and <b> tags embedded in XML contents.
**EDirect Version 6.30: February 13, 2017**
- Efetch -format docsum skips GI-less sequences without summaries.
- Xtract local indexing commands moved to -extras documentation.

**EDirect Version 6.20: January 30, 2017**
- Xtract -limit and -index allow extraction of selected records from XML file.

**EDirect Version 6.10: January 19, 2017**
- Added run-ncbi-converter script for processing ASN.1 release files.
- Xtract -format flush option added.
- Removed obsolete accession-dot-version conversion code.

**EDirect Version 6.00: December 27, 2016**
- Efetch -format docsum removes eSummaryResult wrapper.
- Fixed content truncation bug when Xtract encounters very long sequences.

**EDirect Version 5.90: December 21, 2016**
- Efetch and Elink readied for switch to accession-dot-version sequence identifier.
- Xtract -insd recognizes INSDInterval_iscomp@value and other boolean attributes.
- Xtract adds experimental phrase processing commands for word index preparation.

**EDirect Version 5.80: December 12, 2016**
- Effilter adds shortcuts for -db gene (e.g., -status alive, -type coding).
- Xtract numeric conditional tests can use an element name for the second argument (e.g., -if ChrStop -lt ChrStart finds minus strand genes).

**EDirect Version 5.70: November 30, 2016**
- Xtract -format takes an optional [compact|indent|expand] argument. Processing compact XML is about 15% faster than indent form. Using expand places each attribute on a separate line for ease of reading.

**EDirect Version 5.60: November 22, 2016**
- Fixed bug in -datetype argument for Esearch and Effilter.
- Added optional argument to filter-stop-words script to indicate replacement.

**EDirect Version 5.50: November 16, 2016**
- Efetch -id allows non-numeric accessions only for sequence databases.
- Xtract element selection no longer considers fields in recursive sub-objects.
• Xtract introduces a double-star "/Object" construct to flatten recursive child objects for linear exploration.
• Xtract conditional tests ignore empty self-closing tags.
• Xtract -else simplifies insertion of a placeholder to indicate missing data.

**EDirect Version 5.40: November 7, 2016**
• Added filter-stop-words and xy-plot scripts.

**EDirect Version 5.30: October 31, 2016**
• Added support for ecitmatch utility.
• Added amino-acid-composition and between-two-genes scripts.
• The sort-uniq-count and sort-uniq-count-rank scripts take an optional argument (e.g., -n for numeric comparisons, -r to reverse order).

**EDirect Version 5.20: October 26, 2016**
• Setup script no longer modifies the user’s configuration file to update the PATH variable. Instead, it now prints customized instructions for the user to execute. The user may choose to run these commands, but is free to edit the .bash_profile file manually.
• Xtract deprecates -match and -avoid functions and the Element:Value conditional shortcut.
• Xtract -if and -unless commands use compound statements for conditional execution (e.g., -if Element -equals Value).
• Colon now separates namespace prefix from element name in xtract arguments (e.g., -block jats:abstract). Colon at start of element name matches any namespace prefix.
• Xtract -insd uses a dash as placeholder for missing field. Experimental -insdx command is deprecated.
• Precompiled versions of xtract are now provided for Darwin, Linux, and CYGWIN_NT platforms. The appropriate executable is downloaded by the setup script.

**EDirect Version 5.10: October 13, 2016**
• Xtract adds -0-based, -1-based, and -ucsc numeric extraction/conversion commands for sequence positions from several Entrez databases.

**EDirect Version 5.00: September 26, 2016**
• Efexch -format fasta removes blank lines between records.
• Xtract -insdx uses a dash to indicate a missing field.
• Xtract -insd no longer has blank lines between records.
• Xtract -input allows reading XML data from a file.
EDirect Version 4.90: September 14, 2016
- Epost -input allows reading from an input file instead of using data piped through stdin.
- Efilter now supports the -sort argument.
- Xtract -filter can recover information in XML comments and CDATA blocks.

EDirect Version 4.80: August 9, 2016
- Xtract -insd controlled vocabularies updated.

EDirect Version 4.70: August 4, 2016
- Einfo -db request can also display -fields and -links data summaries.
- Einfo -dbs prints database names instead of eInfoResult XML.

EDirect Version 4.60: July 18, 2016
- Elink -cmd acheck returns information on all available links for a record.
- Efilter -pub structured limits to articles with structured abstracts.

EDirect Version 4.50: July 1, 2016
- Esearch and Efilter detect and report -query phrase quotation errors.
- Efilter -pub shortcut adds last_week, last_month, and last_year choices.
- Efetch sets -strand 2 for minus strand if -seq_start > -seq_stop or if -chr_start > -chr_stop.

- Transitioning to use of https for access to NCBI services.
- Epost -db assembly -format acc uses [ASAC] field instead of [ACCN].

EDirect Version 4.30: June 13, 2016
- Efilter -pub preprint limits results to ahead-of-print articles.
- Xtract -pattern Parent/* construct can now process catenated XML files.

EDirect Version 4.20: May 24, 2016
- Xtract command-line argument parsing improvements.
- Nquire -get supersedes -http get.

- Xtract -format removes multi-line XML comments and CDATA blocks.
EDirect Version 4.00: April 4, 2016
- Esearch adds -spell to correct known misspellings of biological terms in the query string.
- Efilter adds -spell to correct query misspellings, and -pub, -feature, -location, -molecule, -organism, and -source shortcuts. Run efilter -help to see the choices available for each argument.

EDirect Version 3.90: March 21, 2016
- Code optimizations for increased Xtract speed.

- Xtract can distribute its work among available processor cores for additional speed.

EDirect Version 3.70: February 8, 2016
- Xtract performance improvements.

EDirect Version 3.60: January 11, 2016
- The setup.sh configuration script now downloads a precompiled Xtract executable for selected platforms.

EDirect Version 3.50: December 27, 2015
- Xtract reports error for element:value construct outside of -match or -avoid arguments.

EDirect Version 3.40: December 20, 2015
- Xtract -insd supports extraction from multiple features (e.g., CDS,mRNA).

EDirect Version 3.30: December 3, 2015
- Efetch -format docsum can accept a single sequence accession number in the -id argument.

EDirect Version 3.20: November 30, 2015
- Xtract supports -match conditional execution on values recorded in variables.

EDirect Version 3.10: November 18, 2015
- Efetch adds -chr_start and -chr_stop arguments to specify sequence range from 0-based coordinates in gene docsum GenomicInfoType object.
**EDirect Version 3.00: October 30, 2015**
- Xtract rewritten in the Go programming language for speed. The setup.sh configuration script installs an older Perl version (2.99) if a local Go compiler is unavailable.
- Efetch -format docsum only decodes HTML entity numbers in select situations.

**EDirect Version 2.90: October 15, 2015**
- Xtract warns on use of deprecated arguments -present, -absent, and -trim, in preparation for release of much faster version.

**EDirect Version 2.80: September 9, 2015**
- Xtract uses the "*/Child" construct for nested exploration into recursive structures, replacing the -trim argument.

**EDirect Version 2.70: July 14, 2015**
- Added entrez-phrase-search script to query on adjacent word pairs indexed in specific fields.

**EDirect Version 2.60: June 23, 2015**
- Xtract -match and -avoid support "Parent/Child" construct for BLAST XML.

**EDirect Version 2.50: April 9, 2015**
- Xtract capitalized -Pattern handles recursively-defined top-level objects.

**EDirect Version 2.40: March 25, 2015**
- EDirect programs use the http_proxy environment variable to work behind firewalls.

**EDirect Version 2.30: March 11, 2015**
- Cleaned up logic in setup.sh configuration script.
- EPost -format acc works properly on protein accessions.

**EDirect Version 2.20: March 4, 2015**
- Xtract -match and -avoid recognize "@attribute" without element or value.

**EDirect Version 2.10: February 3, 2015**
- Added ftp-ls and ftp-cp scripts for convenient access to the NCBI anonymous ftp server.
EDirect Version 2.00: August 28, 2014

- Introduced copy-and-paste installation commands with setup.sh configuration script.

EDirect Version 1.90: August 8, 2014

- Xtract -format combines multiple XML results into a single valid object.
- Improved suppression of 0-count failure messages with -silent flag in scripts.

EDirect Version 1.80: July 15, 2014

- EPost -format acc accepts accessions in an -id argument on the command line.

EDirect Version 1.70: April 23, 2014

- EFetch -format docsum decodes HTML entity numbers embedded in the text.

EDirect Version 1.60: April 3, 2014

- Minor enhancements to xtract -insd.

EDirect Version 1.50: March 29, 2014

- Esearch -sort specifies the order of results when records are retrieved.
- Xtract exploration arguments (e.g., -block) now work on self-closing tags with data in attributes.

EDirect Version 1.40: March 17, 2014

- Xtract -format repairs XML line-wrapping and indentation.
- Implemented -help flag to display the list of command-line arguments for each function.

EDirect Version 1.30: March 3, 2014

- Xtract -insd partial logic was corrected to examine both 5’ and 3’ partial flags, and the location indicator recognizes "+" or "complete" and ".-" or "partial".

EDirect Version 1.20: February 26, 2014

- Xtract -insd detects if it is part of an EDirect sequence record query, and dynamically executes the extraction request for specific qualifier values. When run in isolation it generates extraction instructions that can be incorporated (with modifications, if necessary) into other queries.
EDirect Version 1.10: February 10, 2014

- ESummary was replaced by "efetch -format docsum" to provide a single command for all document retrieval. The esummary command will continue to work for those who prefer it, and to avoid breaking existing scripts.
- Xtract processes each -pattern object immediately upon receipt, eliminating the need for using xargs and sh to split document retrieval into smaller units.

EDirect Version 1.00: February 6, 2014

- Initial public release.

For More Information

Announcement Mailing List

NCBI posts general announcements regarding the E-utilities to the utilities-announce announcement mailing list. This mailing list is an announcement list only; individual subscribers may not send mail to the list. Also, the list of subscribers is private and is not shared or used in any other way except for providing announcements to list members. The list receives about one posting per month. Please subscribe at the above link.

Getting Help

Please refer to the PubMed and Entrez help documents for more information about search queries, database indexing, field limitations and database content.

Suggestions, comments, and questions specifically relating to the EUtility programs may be sent to eutilities@ncbi.nlm.nih.gov.
