Gastrointestinal Evaluation
1. Targeted H&P (incl. history of pancreatitis, GERD, diabetes)
2. Amylase/Lipase, LFTs

≥10 years²
- MRI/MRCP

Abnormal MRI/MRCP
1. Likely MAS-associated gastrointestinal/pancreatic involvement

Normal MRI/MRCP but GERD symptoms and/or abnormal LFTs
1. Possible MAS-associated gastrointestinal involvement
2. Possible subclinical pancreatic involvement³

Normal MRI/MRCP no GI symptoms
1. MAS-associated gastrointestinal/pancreatic involvement unlikely⁴

≤10 years²
- MRI/MRCP
- 1. Monitor clinically
- 2. MRI/MRCP at 10 years, or when able to undergo imaging without sedation

References

Legend
GERD = gastroesophageal reflux disease; H&P = history & physical exam; LFTs = liver function tests; MAS = McCune-Albright syndrome; MRCP = magnetic resonance cholangiopancreatography

Footnotes:
1 Performed at initial presentation, regardless of clinical symptoms. 2 Age is not based upon clinical evidence, but on age at which patients may undergo MRI/MRCP without requiring sedation. 3 Age of onset of pancreatic cyst development is not established, therefore clinical monitoring for signs of involvement in these patients is indicated. 4 Patients should continue to be monitored clinically for new signs of gastrointestinal/pancreatic involvement including pancreatitis and diabetes.
