"THE KAUFMAN AMALGAM CARRIER"
for Apicoectomy with Retrograde Amalgam Seal

An ideal instrument* to facilitate the amalgam seal of root ends following apicoectomy.
The use of "The Kaufman Amalgam Carrier" enables the operator to carry a particle of amalgam of any given size to the apex and place it there without spillage.

* Designed by Dr. Paul S. Kaufman

Such a simple way to induce general anesthesia

Pentothal® (thiopental) is ideally suited to oral surgery. It is rapid, brief, and easy to administer—either as sole anesthetic in short procedures, or as your induction agent in longer ones. Sleep comes quickly. Narcosis can be increased with great speed when desired. And the promptness with which your patient regains consciousness is more than ample.

Pentothal is simplicity itself to use. Pictured above, for example, is the 5-gram container (one of over a dozen convenient sizes). Simply dilute to the concentration you need. Attach the handy Pentothal Dispensing Cap shown above—and withdraw by syringe as you need during the day.

Note that Pentothal is seldom associated with coughing, sneezing, and other troublesome forms of respiratory irritation. Because it is intravenous, it doesn’t interfere with the oral operating field. Moreover it is free of explosion hazard.

Finally—and important—Pentothal gives you the assurance of a successful clinical experience of 30 years. No other intravenous anesthetic has so wide a background, nor is better understood. We invite you to use Pentothal regularly in your own practice.

Contraindicated in severe respiratory embarrassment, liver or kidney disease, advanced cardiac disease, and porphyria. Use with caution in presence of other disabilities. Pentothal should of course be used only by persons trained in anesthesia, and equipped with proper emergency facilities.

30 years of world-wide use

PENTOTHAL® Sodium

THIOPENTAL SODIUM, ABBOTT
non-explosive, non-flammable

PENTHRANE® METHOXYFLURANE, ABBOTT

a useful new approach to inhalation anesthesia

For operative dentistry, non-explosive anesthesia is essential. This is a major reason why dental anesthesiologists have displayed an active interest in Penthrane. This new general anesthetic can neither burn nor explode in any concentration of oxygen at operating room temperature.

But there are other features that also attract interest.

For example, cardiac rhythm and pulse rate are remarkably well sustained. Blood pressure should fall only slowly, and stabilize slightly below preanesthetic levels.

Though liver disease may rule out a halogenated agent such as Penthrane, the latter has no greater effect on liver function than that of ether or cyclopropane. Toxicity is low, and there is no interference with hemostasis.

The analgesic effect of Penthrane is profound, extending well into the recovery period.

Penthrane is easy to administer, using any modern ether vaporizer. Balanced techniques are most commonly preferred, using Pentothal® (thiopental) to speed the induction, and nitrous oxide and/or oxygen for vaporization. Induction is usually accomplished with a full face mask, shifting to a nasal inhaler for maintenance. Penthrane is of value in all except the shortest procedures.

As with any potent anesthetic, Penthrane should be administered only by persons trained in anesthesia, and equipped with proper emergency facilities. Blood pressure, respiratory depth, and degree of muscle relaxation are the primary guides; Guedel eye-signs do not apply. Only conservative doses of epinephrine, barbiturates, narcotics, tubocurarine, or trimethaphan camphorsulfonate should be used.

unacaine HCl
(Metabutethamine Hydrochloride)
3.8% with Epinephrine 1:60,000

- RAPID
- PROFOUND
- WELL TOLERATED

UNACAINE has been used in millions and millions of injections... produces deep, remarkably intense anesthesia almost immediately. Profound anesthesia is maintained for about 1 hour (just right for high speed operative procedure). Then it disappears and the return to normal is quick and uneventful.

The possibility of long-lasting numbness or of tongue or lip biting at night is eliminated

Use UNACAINE... the local anesthetic that knows when to stop!

- Pre-sterilized
- Fit Any Syringe
- Fit Like Regular Needles

Just as UNACAINE assures safe anesthesia, so the ingeniously designed Novol Needle provides that extra margin of safety that impresses patients and builds practice.

Novol Disposable Needles are easy to use! They fit any type of cartridge syringe just like regular needles and chucks. The specially threaded chuck insures perfect fit... needle shafts can't slip... needles have tri-bevel point... can't be damaged in handling... and the guard can't pop off.

While depth is a reason for confidence

...duration is a matter of choice

**CARBOCAINEx HCl 2% with Neo-Cobefrin® 1:20,000**

*(brand of love-nordetin)*

for deep anesthesia of long duration

Proven clinically to have a wide margin of safety and to be well tolerated by patients of all ages.1-4 Anesthesia is deep, penetrating; duration is sufficiently long that even extremely complicated and extensive surgical procedures seldom require reinjection. Onset of anesthesia is remarkably short5, and ready diffusion into hard and soft tissues assures excellent control of pain.

**CARBOCAINEx HCl 3% without vasoconstrictor**

*(brand of MEPIVACAINE)*

for deep anesthesia of shorter duration

Unique among dental anesthetics in that it consistently produces satisfactory anesthesia without the need of a vasoconstrictor for potentiation, while being well tolerated1-4. Thus it provides the depth you need without unwanted duration — shorter duration of soft tissue anesthesia even in mandibular block injections, yet dependable deep anesthesia lasting long enough for the majority of dental operations, a particularly desirable advantage in children's dentistry and modern high-speed procedures.

The formula is the simplest available: only Carbocaine is added to sterile, isotonic water to make a 3% concentration.

Local anesthetics for dental block and infiltration injections only. Inject slowly and avoid intravascular injection.

These two formulas together meet every need of modern dental procedures.
