Apoptotic Analysis for HT-29 and MCF-7 cells. HT-29 and MCF-7 cells were treated with 10 uM CPT and examined for externalization of phosphatidylserine (Annexin) or caspase activity (CaspaTag). Only the HT-29 cells showed an increase in the Annexin positive / PI negative population of cells characteristic of apoptosis. Furthermore, the HT-29 also showed an increase in the population of cells that were CaspaTag positive / PI negative again characteristic of apoptosis.
